Disaster Risk Assessment to Natural Resource-Based Production Areas

Natural Resource-Based Production Areas (NRBPAs) are also vulnerable/susceptible to disaster impacts. Forest and agricultural resources may be affected once disasters occur in the areas. As precautionary measure, the Disaster Risk Assessment (DRA) to NRBPAs is conducted to enable the city government determine the risk areas and lay down mitigation and adaptation measures to prevent massive disaster destruction in resource-rich areas.

Exposure to Natural Resource Production Areas

The following tables* show NRBPAs that have occurrences of floods and landslides. The likelihood of occurrence differs from one NRBPA to another. The NRBPAs with likelihood score of six (6) have frequent occurrence to disasters, which happen one (1) to three (3) years. Those with a score of five (5) have moderate occurrence to disasters, which happen every three (3) to 10 years. Occasional occurrences with a score of four (4) happen every 10 to 30 years improbable occurrences with a score of three (3) ensure every 100 to 200 years. The scores two (2) and one (1) are called rare event (every 100 to 200 years) and very rare event (every less than 200 years), respectively. Below are the summary of the tables per hazard:

* The column with flood/landslide susceptibility in the succeeding tables indicates that the areas with L are considered as low susceptibility area, M as moderate susceptibility area, and H as high susceptibility area.

Flood – A total of 76 barangays with NRBPA have flood occurrences (Table NR – 1). Of the total, 13 areas have frequent flood occurrences. These are Ma-a, Matina Aplaya, Matina Crossing, Matina Pangi, Talomo Proper, Mandug, Tigatto, Bunawan Proper, Lasang, Gumitan, Tamugan, Marapangi, and Tugbok Proper. At least 12 areas have moderate occurrences to floods, which include Bago Aplaya, Buhangin, Panacan, Calinan, Magsaysay, Malamba, Marilog Proper, Crossing Bayabas, Lizada, Los Amigos, and Mintal. The NRBPA in Bago Gallera, Bucana, Dumoy, Communal, Waan, Mahayag, Gumalang, Malagos, Riverside, Saloy, Wangan, Bantol, Bayabas, Camansi, Lubogan, Sirawan, Toril Proper, and Sto. Niño. The rest of the areas, which are within the 33 barangays, have improbable flood occurrences. Floods may rise at more than one (1) meter in most NRBPA except in Baliok, Daliao, and Talandang where the flood depth is less than one (1) meter. All are either moderate or high susceptible to floods.

Table NR – 26. Natural Resource Production Area Exposure Table, Flood, Davao City

Hazard				Exposure					
Barangay	Flood Susceptibility	Likelihood of Occurrence	Flood Depth	Area by Dominant Crop (Has.)	Dominant Crop/Variety of Produce	Exposed Area	Exposure Percentage	Average potential income per hectare per year (PHP)	Exposed Value
Talomo District									
Bago Aplaya	M/H	5	≥ 1 meter	14.19	banana	2.13	15.02%	29,700	63,308

Landslide – Table NR – 2 shows that landslides happen in 100 barangays with NRBPA in the city. Frequent occurrences are observed particularly in Pandaitan, Buda, and Suawan. Moderate occurrences are also recorded in Langub, Ma-a, Matina Crossing, Tigatto, Fatima, Lumiad, Malabog, Tambobong, Inayangan, Baganihan, Datu Salumay, Gumitan, Malamba, Marilog Proper, Salaysay, Tamugan, and New Carmen. On the other hand, floods occasionally occur in NRBPA particularly in Matina Pangi, Mandug, Paquibato Proper, Baguio Proper, Carmen, and Magsaysay. All are either moderate or high susceptible to landslides.

Consequence Analysis

Part of the DRA is to identify how severe the impact would be when disasters hit the NRBPA's. The severity of consequence, which garners a score of four (4) is very high if over 40% of exposed production areas including fish ponds, crops, poultry and livestock, and other agricultural/forest products are severely damaged. The score three (3) is considered as high especially when 20% to 40% of exposed production areas are severely damaged. The score two (2), is identified as moderate, where 10% to 20% of the exposed production areas are severely damaged. The lowest is one (1), where less than 10% of the exposed production areas are severely damaged.

Flood – Flood incidents are expected to greatly affect the NRBPA in Bucana, Toril, Ma-a, Tigatto, Waan, Lasang, and Los Amigos (Table NR – 3). The extent of damages to natural resources, including farms and fish ponds, are also expected to be high NRBPA within Matina Aplaya, Talomo, Bunawan Proper, Lizada, Calinan, Riverside, Tamugan, Matina Pangi, Mandug, Panacan, Tibungco, Pañalum, Gumalang, Dominga, Bantol, and Gumitan. On the other hand, the severity of consequence is seen to be moderate in Matina Crossing, Ilang, Marapangi, Tugbok Proper, Bago Aplaya, Catalunan Grande, Cabantian, Mahayag, Paquibato Proper, Malagos, Wangan, Magsaysay, Malamba, Crossing Bayabas, Binugao, Lubogan, Ula, Bago Gallera, Baliok, Tapak, Baguio Proper, Suawan, Mintal, Buhangin, and Buda. The rest of the flood-affected areas are low in terms of potential severity.

Table NR – 28. Natural Resource Production Area, Severity of Consequence Estimation, Flood, Davao City

Hazard				Exposure						Vulnerability						Severity Of Consequence	
Barangay	Flood Susceptibility	Likelihood of Occurrence	Flood Depth	Total Area Allocation (Has.)	Dominant Crop/Variety of Produce	Average output per hectare (PHP)	Affected Area (Has.)	Affected Value	Exposure Percentage	Number of farming families who attended climate field school	Proportion of farming families using sustainable production techniques	Number of farmers with access to hazard information	Number of production areas with infrastructure coverage	% Areas with irrigation coverage	% Areas with water impoundment	Number of farming families with access to Early Warning Systems	Severity of Consequence Score

Landslide – A total of 11 barangays with NRBPA may potentially incur massive impacts whenever there are destructive landslides, and thus, rated with the highest severity of consequence score. These are Fatima, Mapula, Paquibato Proper, Sumimao, Tapak, Malabog, Pandaitan, Paradise Embac, Inayangan, Megkawayan, and Gumitan, which are all situated in forest areas. The severity of consequence score for 38 barangays with NRBPA is three (3), which would mean that below 40% of the exposed areas are expected to be greatly affected. The rest of the barangays either have moderate and low severity of consequence scores.

Risk Areas

The succeeding tables below show the overall results of the DRA in terms of NRBPA, which bare the low, moderate, and high risk areas. The results differ depending on the level of likelihood of occurrence and severity of consequence.

Flood – Noting on the possible extent of damages to NRBPA, the natural resources in Bucana, Ma-a, Matina Aplaya, Matina Crossing, Matina Pang, Talomo Proper, Mandug, Tigatto, Waan, Bunawan Proper, Lasang, Panacan, Calinan, Riverside, Gumitan, Tamugan, Lizada, Marapangi, Toril Proper, Los Amigos, and Tugbok Proper are identified as high risk areas (Table NR – 5). On the other hand, the risks in terms of floods are moderate in 32 barangays with NRBPA as well as considered low in 22 barangays with NRBPA.

Table NR – 30. Natural Resource Production Area Risk to Flood, Davao City

Map 6.8. Natural Resource-Based Production Risk Map to Flood, Davao City

Landslide – Landslides are expected to massively hit the natural resources in Langub, Matina Pangi, Lumiad, Malabog, Pandaitan, Paquibato Proper, Carmen, Tambobong, Inayangan, Baganihan, Buda, Datu Salumay, Gumitan, Magsaysay, Malamba, Marilog Proper, Salaysay, Suawan, Tamugan, and New Carmen (Table NR – 6). These areas are identified as high risk areas to landslides. On the other hand, moderate risk areas are plotted in NRBPA within Catalunan Grande, Ma-a, Matina Crossing, Buhangin Proper, Cabantian, Mandug, Tigatto, and Baguio Proper. The rest of the barangays with natural resources have low risk to landslides.

Table NR – 31. Natural Resource Production Area Risk to Landslide, Davao City

Summary of Risk Management Options for Natural Resource-Based Production Areas

The following tables consist the Major Decision Areas for Natural Resource-Based Production Areas (NRBPAs). These areas shall be given with utmost priority to prevent from having massive extent of damages to natural resources, including the agricultural crops, poultry, livestock, and fishes that are crucial for ensuring food security for the entire populace.

Table NR – 1. Summary of Risk Management Options for Natural Resource-Based Production Areas

Major Decision Areas	Description	Area Allocation	Risk Management Options
I			
Marilog District			
Buda	1. Susceptibility: M/H/; 1.1 Likelihood of Occurrence: Frequent; 1.2 Severity of Consequence: High; 2. No of Farming Dependent Households: 554; 3. Total Agricultural Area (Has): 1,422.89; 4. Exposed Area (Has):673.93; 5. Value Affected(PhP): 50,949,549.00; 6. Farming families attended field school: 20; 7. Proportion of families using sustainable techniques : 10; 8. Families with access to hazard information:20; 9. Infra Coverage: Yes; 10. Irrigation Coverage: 1.05; 11. Water Impoundment: ; 12. Access to Insurance: ; 13. Extension Services: Yes; 14. EWS: Yes; 15. Alternative Livelihood: 388; 16. Government Resources: Yes; 17. Risk Category : High	1,422.90	Improve extension services with emphasis on climate and hazard resilient production techniques. Establishment of irrigation and/or rainwater harvesting facilities to sustain 1,422.90 hectares of high value fruit tree production. Encourage the use of risk transfer instrument (i.e. crop insurance) Crop diversification Changing crop and/or those crops with reduced water requirements Establishment of early warning system for agricultural crop production Provision of forestry based alternative and/or non-agriculture based livelihood opportunities Reduced run-off through watershed reforestation or agro-forestry production Establishment of warehouses for temporary storage Establish riverbank easement (i.e. planting of malibago and fruit trees and kawayan)
Suawan	1. Susceptibility: M/H/VH; 1.1 Likelihood of Occurrence: Frequent; 1.2 Severity of Consequence: High;	1,684.68	Improve extension services with emphasis on climate and hazard resilient production techniques. Establishment of irrigation and/or rainwater harvesting facilities to sustain 1,684.68 hectares of

Map 2.1. Population Exposure Map to Flood, Davao City	15
---	----

Climate Change Vulnerability Assessment to Population

Population is among the identified exposure units which are vulnerable to different hazards such as liquefaction, storm surge, floods, landslides, and earthquake within fault line. This section intends to identify the hazard-impact areas and determine interventions especially for the vulnerable and marginalized sectors who face higher exposure to such threats.

Population Exposure Database

The succeeding tables (see beginning next page) include data on population's exposure, vulnerability, and adaptive capacity. Below are the summary of the population exposure database per hazard:

Flood – This hazard can potentially affect 1,625,154 persons, who occupy parcels of residential areas that total to 8,600.07 hectares, in 178 barangays in Davao City (Table PO – 1A to Table PO – 1H). Floods can greatly affect the informal settlers, both the young and old, persons with disabilities, people living in dwelling units with walls made from light to salvageable materials, malnourished individuals, and households living below poverty threshold. Barangay Bucana, which is the most populous barangay with 83,964 persons, has the largest presence of informal settlers that total to 7,405. Talomo Proper also has the highest number of households living in dwelling units with walls made from light to salvageable materials that total to 22,776. Of the total population in Davao City, 40.3% are dependent population or those who are either young (ages 0-14 years old) or old (65 years old and above). On the other hand, the percentage of households living below the poverty threshold is 12%*. The Philippine Statistics Authority (PSA) cites that the Davaoño families consisting of five members, the average family size, shall have a regular monthly income of ₱9,481 to stay out of poverty and meet their basic food and non-food needs. In terms of adaptive capacity, there are approximately 60% of the families in Davao City who have access to post disaster financing and benefits from government agencies like Government Service Insurance System (GSIS) and Social Security System (SSS). A total of 892,578 members and 1,055,525 dependents of Philippine Health Insurance Corp. (PhilHealth) were also identified. Families may also have difficulty to relocate or retrofit given current capacities within short to medium plans. They are only willing to pursue relocation/retrofitting if provided with external assistance from the local and national governments. On another note, the city government has the capacity to generate jobs and provide employment opportunity. The city government, through Public Employment Service Office (PESO), pursues job fairs, special recruitment activities, emergency employment program, Special Program for Employment of Students (SPES), and other programs to provide employment even after disasters. The government also has resources and sufficient budget allocation for disaster-related programs and projects.

* Twelve percent (12%) reflects the poverty incidence or the proportion of families whose income is below the poverty line to the total number of families. This is the poverty incidence rate in Davao del Sur, which includes Davao City in 2015.

Table PO – 1A. Population Exposure Database to Flood, Davao City

Exposure				Vulnerability					Adaptive Capacity								
Barangay	Residential Area	Barangay Population	Population Density Per Hectare of Residential Area	Percentage of Informal Settlers	Percentage of Population Living in Dwelling Units with Walls Made from Light to Salvageable Materials	Percentage of Young and Old Dependents	Percentage of Households Living Below Poverty Threshold	Percentage of Persons with Disabilities	Percentage of Malnourished Individuals (0-72 months)			Access to Post Disaster Financing	PhilHealth Coverage		Household Financial Capacities to Relocate or Retrofit	Government Capacity to Generate Jobs	Government Resources
									Weight for Age	Height for Age	Length or Height for Weight		Members	Dependents

Map 2.1. Population Exposure Map to Flood, Davao City

Landslide – This hazard can potentially affect 1,632,911 persons, who occupy parcels of residential areas that total to 8,655.14 hectares in all barangays in Davao City (Table PO – 2A to Table PO – 2K). Landslides can greatly affect especially the informal settlers, young and old population, persons with disabilities, population living in dwelling units with walls made from light to salvageable materials, malnourished individuals, and households living below poverty threshold. Barangay Bucana, which is the most populous barangay with 83,964 persons, has the largest presence of informal settlers that total to 7,405. Talomo Proper has also the highest number of households living in dwelling units with walls made from light to salvageable materials that total to 22,776. Of the total population in Davao City, 40.3% are dependent population or those who are either young or old. On the other hand, the percentage of households living below the poverty threshold is 12%. In terms of adaptive capacity, there are approximately 60% of the families in Davao City who have access to post disaster financing and benefits from government agencies like GSIS and SSS. A total of 894,340 members and 1,057,773 dependents of PhilHealth were also identified. With regards on their capacity to pursue relocation, families bare that they may only pursue relocation/retrofitting if provided with external assistance from the local and national governments. The city government also has the capacity to generate jobs and provide resources through disaster-related programs and projects.

Map 2.2. Population Exposure Map to Landslide, Davao City

Liquefaction - This hazard can potentially affect 1,250,363 persons, who occupy parcels of residential areas that total to 6,646.45 hectares, in 103 barangays in Davao City (Table PO – 3A to Table PO – 3G). Liquefaction can greatly affect especially the informal settlers, young and old population, persons with disabilities, population living in dwelling units with walls made from light to salvageable materials, malnourished individuals, and households living below poverty threshold. Barangay Bucana, which is the most populous barangay with 83,964 persons, has the largest presence of informal settlers that total to 7,405. Talomo Proper has also the highest number of households living in dwelling units with walls made from light to salvageable materials that total to 22,776. Of the total population in Davao City, 40.3% are dependent population or those who are either young or old. On the other hand, the percentage of households living below the poverty threshold is 12%. In terms of adaptive capacity, there are approximately 60% of the families in Davao City who have access to post disaster financing and benefits from government agencies like GSIS and SSS. There are also 670,016 members and 866,764 dependents of PhilHealth. With regard to relocation options, families within areas that are susceptible to liquefaction bare that they may have difficulty to relocate or retrofit given their current capacity. The city government has also the capacity to generate jobs and resources to pursue disaster-related programs and projects.

Storm Surge - This hazard can potentially affect 892,427 persons, who occupy parcels of residential areas that total to 4,254.91 hectares, in 74 barangays in Davao City (Table PO – 4A to Table PO – 4C). Storm Surge can greatly affect especially the informal settlers, young and old population, persons with disabilities, population living in dwelling units with walls made from light to salvageable materials, malnourished individuals, and households living below poverty threshold. Barangay Bucana, which is the most populous barangay with 83,964 persons, has the largest presence of informal settlers that total to 7,405. Talomo Proper has also the highest number of households living in dwelling units with walls made from light to salvageable materials that total to 22,776. At least 40.3% are considered as dependent population or those who are either young or old. On the other hand, the percentage of households living below the poverty threshold is 12%. In terms of adaptive capacity, there are approximately 60% of the families in Davao City who have access to post disaster financing and benefits from government agencies like GSIS and SSS. There are as well 466,693 members and 523,212 dependents of PhilHealth. With regards on their capacity to pursue relocation, families bare that they may have difficulty to relocate or retrofit given their current capacities. They are only willing to pursue relocation/retrofitting if provided with external assistance from the local and national governments. The city government has also the capacity to generate jobs and resources disaster-related programs and projects.

Map 2.3. Population Exposure Map to Storm Surge, Davao City

Fault Line – The presence of fault line systems can potentially affect 429,238 persons, who occupy parcels of residential areas that total to 2,532 hectares, in 55 barangays in Davao City (Table PO – 5A to Table PO – 5D). The presence of fault line systems can greatly affect especially the informal settlers, young and old population, persons with disabilities, population living in dwelling units with walls made from light to salvageable materials, malnourished individuals, and households living below poverty threshold. Among the barangays with fault line systems, Talomo Proper has the largest number of informal settlers with 4,331 and the highest number of households living in dwelling units with walls made from light to salvageable materials that total to 22,776. At least 40.3% are considered as dependent population or those who are either young or old. On the other hand, the percentage of households living below the poverty threshold is 12%. In terms of adaptive capacity, there are approximately 60% of the families in Davao City who have access to post disaster financing and benefits from government agencies like GSIS and SSS. There are as well 238,704 members and 301,986 dependents of PhilHealth. Meanwhile, families may have difficulty to relocate or retrofit given their current capacities. They are only willing to pursue relocation/retrofitting if provided with assistance from the local and national governments. The city government has also the capacity to generate jobs and resources disaster-related programs and projects.

Map 2.4. Population Exposure Map to Fault Line System and Liquefaction, Davao City

Population Exposure Estimation

The following tables bare the results on the extent of exposed area and population in barangays that are either moderately or highly susceptible to such hazard. The exposed population in the tables is computed by multiplying the population density to the affected area. Below are the summary of the population exposure estimation per hazard:

Flood – Of the 8,600.07 hectares of residential areas that are identified as either low, moderate, or high susceptible to floods, 97% are expected to be exposed to floods (Table PO – 6A to Table PO – 6I). At least 2,153.34 hectares of the potentially exposed areas are considered as affected areas. Also, 31% of the 1,477,788 persons within the potentially exposed areas are identified as exposed population.

Table PO – 6A. Population Exposure Estimation to Flood, Davao City

Landslide - Of the 8,655.14 hectares of residential areas that were identified as either low, moderate, or high susceptible to landslides, 65% are expected to be exposed to landslides (Table PO – 7A to Table PO – 7E). At least 1,201 hectares of the potentially exposed areas are considered as affected areas. Also, 24% of the 904,788 persons within the potentially exposed areas are identified as exposed population.

Liquefaction - Of the 6,646.45 hectares of residential areas that are identified as either low, moderate, or high susceptible to liquefaction, 87% are expected to be exposed to liquefaction (Table PO – 8A to Table PO – 8D). At least 2,422.05 hectares of the potentially exposed areas are considered as affected areas. Also, 52% of the 1,088,592 persons within the potentially exposed areas are identified as exposed population.

Fault Line - Of the 2,532 hectares of residential areas that are identified with presence of fault line systems, 78% are expected to be greatly exposed to fault line systems (Table PO – 10A to Table PO – 10B). At least 753 hectares of the potentially exposed areas are considered as affected areas. Also, 0.44% of the 322,393 persons within the potentially exposed areas are identified as exposed population.

Population Degree of Impact Rating

The succeeding tables include degree of impact rating, which represents the level and kind of impacts the system will likely experience and the time and resources needed for interventions to return to pre-impact levels. The rating is an output during the workshop, where the exposure elements and sensitivity indicators are carefully assessed. The score varies from one (1) being the lowest to three (3) being the highest. The lowest score (1) indicates that the estimated direct and indirect impacts are low to negligible, which can be felt within a short-term period. The moderate score (2) is provided when there would be expected moderate direct impacts in terms of number of fatalities, injuries, and value of damaged properties. The high score (3) is given in areas where the impact of such hazard is expected to be disastrous given the extent of exposure and current sensitivity of the system. Below are the summary of the tables per hazard:

Flood – The highest degree of impact rating is given to Barangays 1-A, 2-A, 5-A, 8-A, 22-C, 23-C, 31-D, 39-D, and 40-D in Poblacion District, Agdao Proper, Centro, Gov. Paciano Bangoy, Gov. Vicente Duterte, Tomas Monteverde, Lapu-Lapu, Leon Garcia Sr., and Rafael Castillo in Agdao District, Baguio Proper in Baguio District, Tigatto and Waan in Buhangin District, Lasang, Bunawan, and Panacan in Bunawan District, Biao Joaquin, Calinan Proper, Dalagdag, Dominga, Pangyan, Riverside, Subasta, Talomo River, and Wangan in Calinan District, Tamugan in Marilog District, Sumimao in Paquibato District, Bago Gallera, Bucana, Ma-a, Matina Aplaya, Matina Crossing, Matina Pangi, and Talomo Proper in Talomo District, Bankas Heights, Binugao, and Lubogan in Toril District, and Angalan, Balengaeng, Biao Guianga, Los Amigos, Matina Biao, Mintal, New Carmen, New Valencia, Tacunan, Tagakpan, Talandang, Tugbok Proper, and Ula in Tugbok District. These barangays are flood-affected areas, which are identified as near the waterways with presence of vulnerable sectors like informal settlers and households living in dwelling units made from light to salvageable materials (Table PO – 11A to Table PO – 11E).

Table PO – 11A. Population Degree of Impact Rating to Flood, Davao City

Liquefaction – The highest degree of impact rating is given to Barangays 1A-40D in Poblacion District, Centro, Gov. Paciano Bangoy, Gov. Vicente Duterte, Tomas Monteverde, Lapu-Lapu, Leon Garcia Sr., Rafael Castillo, San Antonio, Ubalde, and Wilfred Aquino in Agdao District, Tigatto, Vicente Hizon, and Waan in Buhangin District, Lasang, Bunawan Proper, Panacan, and San Isidro in Bunawan District, Bago Aplaya, Bago Gallera, Catalunan Grande, Dumoy, Ma-a, Matina Aplaya, Matina Crossing, and Talomo Proper in Talomo District, and New Carmen in Tugbok District. These barangays are expected to be highly affected to liquefaction as these are either near waterways or coastal areas. These barangays also have presence of vulnerable sectors (Table PO – 13A to Table PO – 13C).

Storm Surge – The highest degree of impact rating is provided to Barangays 1A-40D in Poblacion District, Agdao Proper, Centro, Gov. Paciano Bangoy, Gov. Vicente Duterte, Tomas Monteverde, Lapu-Lapu, Leon Garcia Sr., Rafael Castillo, San Antonio, Ubalde, and Wilfredo Aquino in Agdao District, Lasang and Bunawan Proper in Bunawan District, Bago Aplaya, Bucana, Matina Aplaya, and Talomo Proper in Talomo District, and Daliao and Lizada in Toril District. These are near Davao Gulf, which may potentially experience up to 5-meter storm surge. A large number of population, including the vulnerable sector, is also potentially exposed to such hazard (Table PO – 14A to Table PO – 14C).

Table PO – 14A. Population Degree of Impact Rating to Storm Surge, Davao City

Fault Line – The highest degree of impact rating is given to Barangays Catalunan Pequeño in Talomo District, and Los Amigos, Mintal, and Tugbok Proper in Tugbok District. These barangays are within fault line systems. The impact of such hazard is expected to be high in these areas where there are a large number of exposed population and vulnerable sectors (Table PO – 15A to Table PO – 15B).

Table PO – 15A. Population Degree of Impact Rating to Fault Line, Davao City

Population Adaptive Capacity

The following tables contain adaptive capacity scores, where the adaptive capacity indicators describe whether the system is able to accommodate or cope with the impacts with very minimal disruption or short to long term detrimental effects/impacts. The adaptive capacity rating is determined by getting the average of the assessment scores, where one (1) is the highest, two (2) is moderate, and three (3) is the lowest. The high score (1) signifies that there are adaptation measures in place to address impacts. The moderate score (2) indicates that it can accommodate within its resources the cost for adapting and mitigating impacts. The low score (1) shows that the system is not flexible to accommodate climate changes. Below are the summary of the tables per hazard:

Flood – The areas with the lowest adaptive capacity scores in curbing the effect of floods include Barangays 1-A, 2-A, 5-A, 8-A, 15-B, and 19-B in Poblacion District, A. Angliongto, Buhangin Proper, Cabantian, Callawa, Communal, and Indangan in Buhangin District, Bunawan Proper, Panacan, and Ilang in Bunawan District, Bucana, Matina Aplaya, Matina Crossing, Matina Pangí, and Talomo Proper in Talomo District, and Los Amigos in Tugbok District. These areas have 151,919 of exposed population to floods (Table PO – 16A to Table PO – 16E).

Population Vulnerability Index

The succeeding tables show the vulnerability indices to population. The vulnerability index is calculated by multiplying the degree of impact scores to adaptive capacity scores. The index scores are translated into vulnerability categories, where the vulnerability is either high, moderate, or low. Areas with high vulnerability are those where expected impacts to the population is high, due to the exposure and sensitivities, and the adaptive capacities are low to accommodate or cope with the expected effects. Those with low vulnerability show that these areas have high adaptive capacities. Below are the summary of the tables per hazard:

Flood – Results show that the residential areas in Barangays 1-A, 2-A, 5-A, and 8-A in Poblacion District, Tigatto in Buhangin District, Bunawan Proper and Panacan in Bunawan District, Bucana, Matina Aplaya, Matina Crossing, Matina Pangí, and Talomo Proper in Talomo District, and Los Amigos in Tugbok District are highly vulnerable to floods (Table PO – 21A to Table PO – 21D). These areas are expected to experience massive effects (e.g., damage to properties, loss of lives) whenever there are immense incidences of floods. The exposed population in these areas, which total to 130,997, also have low adaptive capacities.

Table PO – 21A. Population Vulnerability to Flood, Davao City

Barangay	Affected Area (Has)	Exposed Population	Exposure Percentage	Degree of Impact	Adaptive Capacity Score	Vulnerability Index	Vulnerability Category
Poblacion District							
1-A	6.94	2,996	97%	3	3	9	High
2-A	1.23	2,660	74%	3	3	9	High
5-A	14.12	7,409	65%	3	3	9	High
8-A	47.94	6,168	56%	3	3	9	High

Map 2.5. Population Vulnerability Map to Flood

Landslide - Results show that the residential areas in Barangays Carmen and Tambobong in Baguio District, Acacia, Communal, and Indangan in Buhangin District, Gatungan and Mudiang in Bunawan District, Dalagdag, Inayangan, Lamanan, Lampianao, Megkawayan, Saloy, and Tamayong in Calinan District, Bantol, Dalag Lumot, Gumitan, Magsaysay, Malamba, Marilog Proper, Salaysay, and Suawan in Marilog District, Colosas, Fatima, Lumiad, Malabog, Mapula, Pandaitan, Pañalum, Paquibato Proper, Paradise Embac, Salapawan, Sumimao, and Tapak in Paquibato District, Langub, Ma-a, Magtuod, Matina Crossing, and Matina Pangi in Talom District, Atan-Awe, Baracatan, Bayabas, Binugao, Camansi, Catigan, Daliaon Plantation, Eden, Sibulan, Tagurano, and Tibuloy in Toril District, and Matina Biao in Tugbok District are highly vulnerable to landslides (Table PO – 22A to Table PO – 22C). These areas are expected to experience massive effects whenever there are immense incidences of landslides. The exposed population in these areas, which total to 166,567, also have low adaptive capacities.

Map 2.6. Population Vulnerability Map to Landslide

Liquefaction - Results show that the residential areas in Barangays 21-C, 22-C, 23-C, 31-D, and 37-D in Poblacion Distric, Centro, Gov. Vicente Duterte, and Lapu -Lapu in Agdao District, Lasang, Bunawan Proper, and Panacan in Bunawan District, Bago Aplaya, Bucana, Dumoy, Matina Aplaya, and Talomo Proper in Talomo District, Binugao, Daliao, Lizada, and Sirawan in Toril District are highly vulnerable to liquefaction (Table PO – 23A to Table PO – 23C). These areas are expected to experience massive effects whenever there are immense incidences of liquefaction. The exposed population in these areas, which total to 304,927, have also low adaptive capacities.

Table PO – 23A. Population Vulnerability to Liquefaction, Davao City

Disaster Risk Assessment for Population

Almost all of the exposure units can be computed of their monetary value and possible replacement except population. To curb down the number of victims and fatalities during disaster incidents, the city government pursues Disaster Risk Assessment (DRA). The DRA will help determine risk areas and analyze adaptive capacities of identified risk areas. This intends to strengthen the capacities especially of people at risk to such hazards (e.g., floods, landslides).

Population Exposure Estimation

The following tables (see beginning next page) comprise data on areas where there are occurrences of hazards and population exposure estimation database. Below are the summary of results per hazard:

Flood – The areas with high susceptibility to floods have an estimated flood depth of more than one (1) meter. Those with moderate to low susceptibility to floods have below one (1) meter of flood depth. Table PO – 1 shows that there are occurrences of floods in 21 barangays in Poblacion District, five (5) in Agdao District, eight (8) in Buhangin District, five (5) in Bunawan District, eight (8) in Calinan District, seven (7) in Marilog District, four (4) in Paquibato District, 12 in Talomo District, 12 in Toril District, and nine (9) in Tugbok District. Of the affected areas, floods frequently hit Barangays 19-B, Mandug, Lasang, Gumitan, Tamugan, Ma-a, Matina Aplaya, Matina Crossing, Matina Pangí, Talomo Proper, Marapangi, and Tugbok Proper. This means that floods occur every one (1) to three (3) years. These areas also experience a flood depth of more than one (1) meter. Floods may potentially hit a large number of populace particularly in Ma-a, Matina Aplaya, Matina Crossing, Matina Pangí, and Talomo Proper. Talomo Proper, for instance, is estimated to have 35% of exposed population out of 59,678 persons living in the barangay.

Table PO – 31. Population Exposure Estimation to Flood, Davao City

Hazard				Exposure					
Barangay	Flood Susceptibility	Likelihood of Occurrence	Flood Depth	Residential Area	Barangay Population	Population Density per Hectare of Residential Area	Affected Area	Exposed Population	Exposure Percentage
Poblacion District									
1-A	High susceptibility area	3	≥ 1 meter	15.36	3,103	202	6.94	1,402.46	45%

Landslide – Table PO – 2 bares the occurrences of landslides in two (2) barangays in Poblacion District, two (2) in Baguio District, three (3) in Buhangin District, three (3) in Bunawan District, two (2) in Calinan District, eight (8) in Marilog District, four (4) in Paquibato District, six (6) in Talomo District, and one (1) in Toril District. Out of the affected areas, Barangays Marilog Proper, Tamugan, Tapak, Matina Crossing, and Matina Pangi have frequent occurrences of landslides. Frequent occurrences of landslides, whether caused by heavy rains or tremors, may largely hit Matina Pangi and Matina Crossing, affecting an estimated number of 2,004 persons and 1,941 persons, respectively.

Severity of Consequence

The severity of consequence score shall be based on expected magnitude of the hazard, the extent of exposure, and the vulnerabilities of the exposed elements. With regards to population, the highest severity of consequence score is four (4) depicts that more than 20% of the population are affected and in need of immediate assistance. The score, three (3), means that 10 to below 20% of affected population are in need of immediate assistance. There are also records of one (1) to 10 deaths or 10 to 100 people with injuries. The moderate is two (2) where there are 5% to less than 10% of affected that need of immediate assistance and one (1) to 10 people with injuries. The least is one (1), where there are less than 5% of the affected population who need of immediate assistance. Those areas with the lowest scores have only cases of minor injuries.

Flood – The flood-affected areas with the highest severity of consequence score, four (4), are Barangays 1-A, 5-A, 6-A, 7-A, 8-A, 9-A, 10-A, 11-B, 20-B, Gov. Paciano Bangoy, Bucana, Matina Aplaya, Talomo Proper, and Toril Proper (Table PO – 3). These areas have exposed population of more than 20%, with need of immediate assistance during flood incidents.

Landslide

None of the barangays in Table PO – 4 have a severity of consequence score of four (4). The next highest, which is three (3), is only given to Barangays Ma-a and Matina Pang, with less than 20% population which need of immediate assistance. The rest of the barangays have low severity of consequence scores of either

Risk Estimation

Risk estimation is computed by multiplying the likelihood of occurrence score to the severity of consequence score. The areas with risk scores ranging from 12 to 24 are considered as high risk areas, which have very high to moderate of severity of consequence and frequent occurrences of such hazard. The score ranging from five (5) to below 12 are called as moderate risk areas, where their likelihood of occurrence of a hazard event is either improbable or rare event with very high to moderate severity of consequence. The least are those scores below five (5), which have very rare hazard events and pertain to moderate to low severity of consequence.

Flood – Results of the risk estimation show that Barangays 1-A, 5-A, 6-A, 7-A, 8-A, 9-A, 10-A, 11-B, 19-B, 20-B, Gov. Paciano Bangoy, Calinan Proper, Bago Aplaya, Bucana, Ma-a, Matina Aplaya, Matina Crossing, Matina Pang, Talomo Proper, Lubogan, Toril Proper, and Tugbok Proper have the highest risk scores ranging from 12 to 24, which depict that these are high risk areas to floods (Table PO – 5). Both likelihood of occurrence score and severity of consequence score are high in these areas, with a corresponding large number of population.

Table PO – 35. Population Risk to Flood, Davao City

Hazard				Exposure						Vulnerability						Severity Of Consequence	Risk			
Barangay	Flood Susceptibility	Likelihood of Occurrence	Flood Depth	Residential Area	Barangay Population	Population Density per Hectare of Residential Area	Affected Area	Exposed Population	Exposure Percentage	Percentage Informal Settlers	Percentage of Population living in dwelling units with walls made from light to salvagable materials	Percentage of young and old dependents	Percentage of households living below the poverty threshold level	Percentage of persons with disabilities	Percentage of Malnourished Individuals (0-72 months)			Severity of Consequence Score	Risk Estimation	Risk Category

Map 2.9. Population Risk Map to Flood, Davao City

Landslide

Results of the risk estimation bare that Barangays Ma-a, Matina Crossing, and Matina Pangli have been identified as high risk areas. Vulnerable sectors including informal settlers are present in these barangays, thereby, making these highly at risk whenever there are occurrences of landslides.

Major Decision Areas for Population

The succeeding tables show the Major Decision Areas (MDAs) population, which shall be given with utmost priority by the city government. The prioritization varies per level. Those under MDA I shall be the top areas of concern where there are a large number of population. The areas in MDA II shall be the next areas of concern. The last, though shall be also given with priority, are those in MDA III.

Table PO – 39A. Major Decision Areas Matrix for Population, Davao City

Major Decision Areas	Description	Problems/Hazards	IPOacts/IPOlications	Policy Interventions
MDA I				
Brgy. 1-A	<ul style="list-style-type: none"> The barangay is near Davao River 	<ul style="list-style-type: none"> The barangay is vulnerable to the occurrence of floods 	<ul style="list-style-type: none"> Potential submergence of settlement areas that may result to the displacement of communities and eventually, loss of lives when there are no proper early warning systems Communities may lose their source of livelihood and income Evacuation is difficult during night time Potential outbreak of diseases such as dengue and leptospirosis 	<ul style="list-style-type: none"> Strict iPOlementation of Urban Development and Housing Act, which mandates that there shall be no dwelling units in danger areas like waterways, riverbanks, and shorelines The informal settlers shall be relocated in tenement housing building, which should be set up within the barangay but observe an easement from the waterway Pursue flood control measures The National Greening Program, which is targeted to prevent soil erosion and flooding, shall be expanded Establish evacuation center equipped with utilities and other amenities like comfort rooms, and conjugal rooms Set up state-of-the-art early warning device system Strengthen the Barangay Disaster Risk Reduction and Management Council
Brgy. 2-A	<ul style="list-style-type: none"> The barangay is near Davao River 	<ul style="list-style-type: none"> The barangay is vulnerable to the occurrence of floods 	<ul style="list-style-type: none"> Potential submergence of settlement areas that may result to the displacement of communities and eventually, loss of lives when there are no proper early warning systems Communities may lose their source of livelihood and income Evacuation is difficult during night time Potential outbreak of diseases such as dengue and leptospirosis 	<ul style="list-style-type: none"> Strict iPOlementation of Urban Development and Housing Act, which mandates that there shall be no dwelling units in danger areas like waterways, riverbanks, and shorelines The informal settlers shall be relocated in tenement housing building, which should be set up within the barangay but observe an easement from the waterway Pursue flood control measures The National Greening Program, which is targeted to prevent soil erosion and flooding, shall be expanded Establish evacuation center equipped with utilities and other amenities like comfort rooms, and conjugal rooms Set up state-of-the-art early warning device system Strengthen the Barangay Disaster Risk Reduction and Management Council

URBAN USE

CLIMATE CHANGE VULNERABILITY ASSESSMENT

The tables below show an assessment of the exposure of urban land use areas such as residential, agri-industrial, commercial, parks and recreation, commercial, tourism, industrial, and cemetery, to flood, landslide, liquefaction, fault line, storm surge, and liquefaction.

On the exposure column are data on the land uses, total area allocation per land use per barangay, and replacement cost computed per square meter.

The sensitivity column enumerates the variables used to determine conditions of structures in terms of proportion of buildings with walls made of light to salvageable materials, proportion of buildings in dilapidated/condemned condition, structure not employing hazard resistant building design, no access/area coverage to infrastructure related hazard mitigation measures and measured from residual, low, moderate, high, very high ratings.

Another element considered is the adaptive capacity of these structures which is determined by the capacity and willingness to retrofit, relocate, or conform to new regulations, insurance coverage, available alternative sites, government resources and local government capacity to impose/implement zoning regulations.

ON EXPOSURE ATTRIBUTE

FLOOD

A total of 122 barangays have a land area of 7,852.1 hectares for residential use, 51 barangays with a land area of 818.13 hectares for commercial use, 45 barangays with 894.22 hectares utilized for industrial use, 37 barangays covering 535.65 hectares used for agri-industrial purposes, 19 barangays with 168.78 hectares for tourism use, eight (8) barangays with 59.99 hectares used as cemetery, and parks and recreation. From these data, a total of 161.40 hectares from 46 barangays are all exposed to flood.

Taking into account sensitivity, the proportion of buildings in dilapidated/condemned condition was considered as a measure. Data below reveal that there are 39 residential areas rated very high, 38 residential areas with high, 27 residential areas moderate, 18 residential areas with residual, 212 barangays with the following uses: commercial (51), parks and recreation and industrial at 45 each, residential 38, agri-industrial 37, tourism 19, and cemetery eight (8) with low ratings are all exposed to again with moderate, residential 21 mostly agri-industrial areas with low, and four (4) residential areas again with residual ratings.

All 122 residential areas do not have the capacity and willingness to retrofit or relocate or conform with new regulations though there are identified alternative sites. The rest of the land uses are all capable and are willing to retrofit, relocate and conform to new regulations, though for most there are no available alternative sites yet.

Map 4.1 Urban Use Area Exposure Map to Flood

LANDSLIDE

A total of 90 barangays with 5,276.99 hectares for residential use, 14 barangays with 297.32 hectares utilized for commercial purposes, 20 barangays with 635.05 hectares for industrial use, 18 barangays with combined land area of 315.02 hectares for agri-industrial use, 16 barangays with 200.75 hectares for tourism use, five (5) barangays with 130.23 hectares of land for cemetery, and 12 barangays with 122.19 hectares used as parks and recreation areas are all exposed to landslide.

Taking into account sensitivity, there are 44 barangays mainly residential with very high sensitivity rating, 24 barangays with high sensitivity rating, 61 with moderate sensitivity rating, mostly for tourism use, 35 barangays with low sensitivity rating, majority is for industrial use, and nine (9) barangays with residual rating, mostly for residential use.

As with the other hazards, most if not all residential areas are not capable and are not willing to retrofit and relocate or conform with new regulations even if there are available alternative sites; while most parks and recreation, commercial, industrial, agri-industrial, tourism are willing to retrofit and relocate. The downside though is there are still no available alternative sites.

Table U-2. Urban Use Area Exposure to Landslide, Davao City

Map 4.2 Urban Use Area Exposure Map to Landslide

LIQUEFACTION

Residential areas in 84 barangays with a total land area of 5,554.45 hectares, commercial areas of 66 barangays with 990.73 hectares, industrial areas of 49 barangays with land area totalling 792.15 hectares, agri-industrial areas of 7 barangays with 123.15 hectares, tourism areas of 13 barangays with a land area of 34.92, three (3) barangays with a land area of 45.63 hectares used as cemetery, and parks and recreation areas of 27 barangays with a land area of 36.07 hectares are all exposed to liquefaction.

For sensitivity, residential areas in 19 barangays have very high rating, 26 have high rating; 71 have moderate rating; 161 barangays have low rating with commercial as the dominant use.

In terms of adaptive capacity, residential areas exposed have no capacity and are not willing to retrofit or relocate or conform with new regulations though there are identified relocation sites. Exposed commercial, agri-industrial, tourism, and parks and recreation areas have the capacity to retrofit and relocate but areas for relocation are yet to be identified.

Barangay	Existing land Use (Specific Use)	Total Area Allocation per Land Use Per Barangay	Replacement Cost (PHP per sq. meter)	Proportion of buildings with walls with light to salvageable materials	Proportion of buildings in dilapidated/ Condemned Condition	Structure not employing hazard resistant building design	No access/ area coverage to infrastructure related hazard mitigation measures	Capacity and willingness to retrofit or relocate or conform with new regulations	Insurance Coverage	Available Alternative Sites	Government Resources	Local Government Capacity to impose/ implement zoning regulations
TORIL	Commercial	24.53	15,000.00	Low	Low	Low	Very High	YES	YES	NO	YES	YES
NEW CARMEN	Residential	15.64	10,000.00	Very High	Very High	Low	Very High	NO	NO	YES	YES	YES

FAULTLINE

Data in the table below reveal the following barangays exposed to fault line: 25 barangays with a total of 1,827.78 hectares designated for residential use; four (4) barangays with 25.11 hectares allocated for commercial use, two (2) barangays with a 69.72 hectares for industrial, nine (9) barangays with 230.74 hectares for agri-industrial, two (2) barangays with 1.95 hectares for tourism, three (3) barangays with 2.90 hectares, and a barangay with 3.97 hectares utilized as cemetery.

Considering sensitivity ratings, the proportion of buildings in dilapidated/condemned condition is accounted as a measure. Data below reveal there are four (4) residential areas with very high, 14 residential areas still with high, three (3) residential areas again with moderate, 21 mostly agri-industrial areas with low, and four (4) residential areas again with residual ratings.

In terms of adaptive capacity, residential areas exposed have no capacity and are not willing to retrofit or relocate or conform with new regulations though there are identified relocation sites. Exposed commercial, agri-industrial, tourism, and parks and recreation areas have the capacity to retrofit and can relocate but areas for relocation have yet to be identified.

Map 4.3 Urban Use Area Exposure Attribute to Liquefaction and Fault line

STORM SURGE

A total of 3,666.32 hectares of residential areas in 72 barangays, 1,126.60 hectares of commercial areas in 65 barangays, 880.83 hectares of industrial use in 39 barangays, a 1.86 hectares of land in a barangay utilized for agri-industrial use, 17.77 hectares in 10 barangays designated for tourism use, and 122.28 hectares in 41 barangays used as parks and recreation are all exposed to storm surge.

Taking into account sensitivity ratings, the proportion of buildings in dilapidated/condemned condition is considered as a measure. Data in the table below reveal there are 17 residential areas with very high, 22 residential areas still with high, 81 barangays with parks and recreation as dominant use, and 108 barangays with low rating with commercial as dominant use.

In terms of adaptive capacity, residential areas exposed have no capacity and are not willing to retrofit or relocate or conform with new regulations though there are identified relocation sites. Exposed commercial, agri-industrial, tourism, and parks and recreation areas have the capacity to retrofit and relocate but areas for relocation have yet to be identified.

Map 4.4 Urban Use Area Exposure Map to Storm Surge

URBAN USE EXPOSURE ESTIMATION

FLOOD

Exposure Estimation

Based on the shown table above, the determined area most exposed to flood is within the residential area of 76 barangays with a total area of 5,212.20 hectares. As per assessment, 23% of the total residential area has high exposure to hazard in which, when hazard-induced damages take place in the area, may cost an approximate exposed value of Php 12,259,500,000.

Table U-6. Urban Use Area Exposure Estimation for Flood, Davao City

LANDSLIDE

Based on the table shown, residential use area is most exposed to landslide, totalling to 90 barangays with a total area of 5,276.49 hectares. As per assessment, 21.4% of the total residential area has high exposure to hazard in which, when hazard-induced damages take place in the area, may cost an approximate exposed value of Php 116,573,000,000.

LIQUEFACTION

Residential, commercial and industrial areas are urban use areas most exposed to liquefaction. As shown in the table, residential areas have 83 barangays which are exposed to liquefaction. The identified barangays were assessed to have an accumulated area of 5,434.07 hectares wherein 44.52% of the total residential area is highly exposed to liquefaction. Moreover, the commercial area seconded with 75 exposed barangays which have a total land area of 990.73 hectares. A percentage of 76.7 of the total commercial area is foreseen to take the most damage. Lastly, the industrial area came in third as 50 barangays were identified to have hazard susceptibility. A total of 912.52 hectares constitute the industrial area and 57.3% of which is exposed to liquefaction. The exposed values of the identified urban use areas are Php 242,344,970,983.36, Php 114,008,914,141.13, and 78,395,913,631.67, respectively.

STORM SURGE

Residential areas, commercial areas, and industrial areas have topped as the most exposed urban use areas for storm surge. As shown in the table a total of 72 barangays with residential urban use have areas exposed to storm surge. These barangays have an accumulated area of 3,666.32 hectares in which 36.2% of the total residential area is highly susceptible to storm surge. Moreover, the number of barangays with commercial use susceptible to storm surge is the second highest at 65 with corresponding total land area of 1,126.60 hectares. Out of these barangays, 47.6% of the total commercial area are foreseen to take the most damage. Lastly, the number barangays with industrial use came in third at 39, totalling 880.843 hectares all in all and out of these hectares, 38% is exposed to storm surge. The exposed values of the identified urban use areas are Php 134,813,338,505.36, Php 80,590,650,929.35, and 50,266,027,887.23, respectively.

FAULTLINE

Residential areas and agro-industrial areas are among the urban uses susceptible to active fault. In the count of barangays with urban use, residential is the highest with a total of 25 barangays with an actual existing area of 1,827.78 hectares. However as per assessment 0.41% of these residential area is highly susceptible to active fault wherein the expose value of damage is at Php 753,342,241. On the other hand, the agro-industrial areas is also exposed to active fault with a total of 9 barangays constituting an area of 230.74 hectares. Any foreseen damages brought about by earthquake will damage 0.66% of the total agro-industrial area which corresponds to an exposed value of Php 228,227,334.

DEGREE of IMPACT RATING

FLOOD

A percentage 77.63 of the total exposed barangays has the highest degree of impact among the urban use areas exposed to flood. These identified barangays have a total area of 4,750.60 hectares wherein a 25.16% of the total area is highly susceptible to hazard which corresponds to an exposed value of Php 12,234,500,000.

The top three (3) barangays with a high degree of impact for flood are residential areas in Talomo, Ma-a, and Tugbok with 226.76 hectares, 136.31 hectares, and 107.98 hectares land area respectively. Exposed values are pegged at P2,267,600,000, P1,363,100,000, and P 1,079,800,000.

LANDSLIDE

Out of the 90 barangays with residential use susceptible to landslide, 69 barangays have the highest degree of impact score. These identified barangays have a total area of 3,882.25 hectares which 28.44% of it is exposed to landslide. Exposed value is pegged at Php 114,041,000,000.

Residential sections in Ma-a, Matina Pangl, and Cabantian with exposed land areas of 101.76, 64.73, and 83.13 respectively are the top three barangays registered with high impact to landslide. The exposed value of the residential area in Ma-a is P10,176,000,000; Matina Pangl is P9,709,500,000; and at P8,313,000.000.

LIQUEFACTION

Residential, commercial, and industrial urban uses have high degree of impact for liquefaction. As per evaluation, 70 out of 75 barangays with residential use have the highest score of 3 for the degree of impact. The percentage of exposure from the total area of residential use in the identified barangays is at 48.5%. Moreover, commercial uses in 70 barangays have also high degree of impact covering 82% of the 927.01 hectares total area of the identified barangays. Lastly, for the industrial uses with high degree of impact for liquefaction is present in 40 barangays. Such areas which could take on a lot of damage cover 57.7% of the 902.73 hectares total land area of barangays susceptible to liquefaction. Exposed values of each identified areas are Php 242,333,145,766.65, Php 113,995,599,455.82, and Php 78,196,203,399.46, respectively.

STORM SURGE

The top three urban use areas with a high degree of impact are residential, commercial and industrial area. As per evaluation, only one barangay with residential use susceptible to liquefaction does not have high degree of impact. Same holds true in commercial area wherein 64 out of 65 exposed barangays have high degree of impact. In industrial area, 36 out of 39 barangays susceptible to storm surge have high degree of impact. As for the residential area, the total area of the 71 barangays measure up to 3,616.34 hectares wherein 36.71% is expected to take greater damage from storm surge with a corresponding exposed value of Php 134,806,687,845.64. On the other hand, damage in exposed commercial areas may reach up to P80, 491,650,929.35 as areas with high degree of impact take up 61% of the 879.25 hectares total commercial area of barangays identified. The industrial areas with high degree of impact take up 41.6% of the total area industrial area of barangays affected with expected damage cost of Php 49,070,553,869.38.

FAULTLINE

As per data evaluation, 4 (four) out of the 25 barangays located in the residential area which are susceptible to active fault have a degree of impact score of 3, which is the highest score among the urban use areas. The four barangays have a total land area of 438.05 hectares in which 0.67% of it is highly exposed to the hazard. Exposed value is set at Php 294,951,425.

ADAPTIVE CAPACITY

FLOOD

The same numbers of barangays in the residential area, which have the high degree of impact, are recorded to have the lowest adaptive capacity. Capacities vary on the three (3) variables indicated below in terms of: a.) capacity and willing to retrofit or relocate or conform to new regulations; b.) insurance coverage, and c.) available alternative sites. Those with low adaptive capacity have no capacity and willingness to retrofit or relocate or conform to new regulations and no insurance coverage. However, these barangays have alternative sites and Most of the 231 barangays have available government resources at their disposal and are empowered to implement zoning regulations. Among the top three (3) barangays whose residential areas have low adaptive capacity are 1-A, 2-A, 5-A.

LANDSLIDE

Out of the 90 exposed barangays, 79 barangays have the lowest adaptive capacity. The above identified barangays have a total area of 4,954.82 hectares with 22.76% of it is highly susceptible to landslide which costs an exposed value of Php 116,384,000,000. Comparing the data between the degree of impact and the adaptive capacity, a result can be concluded that the adaptive capacity of the residential area is at its lowest due to the very high level of no access/area coverage to infrastructure related hazard mitigation measures of the area.

LIQUEFACTION

Top three urban areas residential, commercial and industrial with high degree of impact also have the low adaptive capacity. Residential areas have low structure employing hazard resistant/adaptation design and no capacity or willingness to retrofit or relocate or conform to new regulations.

STORM SURGE

The same numbers of barangays in the residential area, commercial area, and industrial area, which have high degree of impact have low adaptive capacity. Residential area have the lowest adaptive capacity among the top three exposed urban use areas due to the lack of capacity and willingness of barangays to retrofit/relocate/conform with new regulations and no insurance coverage for the affected barangays.

FAULTLINE

Overall, there are 25 barangays located in fault line areas which registered a low adaptive capacity and an adaptive capacity average equivalent to three (3) in dealing with the impact of an earthquake. Though government resources and alternative sites are readily available as few of the efforts to mitigate the damages of earthquake, the barangays have no capacity and willingness to retrofit/relocate/conform with new regulations and no insurance coverage for the barangays in the residential area.

VULNERABILITY

FLOOD

Out of 76 barangays which are highly susceptible to flooding, a total of 59 barangays have residential areas vulnerable to flood. These 59 barangays have high degree of impact and low adaptive capacity. These high degree of impact areas takes a 77.68% of the total residential areas susceptible to flood, and damage to such is pegged at 12,234,500,000. Out of 59 barangays 37 have high to very high proportion of buildings with walls with light material and also high to very high proportion of buildings in dilapidated and condemned condition and 44 have moderate rating in structure employing hazard resistant design, while 15 have high rating. All of the 59 barangays have “very high rating” for no access/area coverage to infrastructure related hazard mitigation.

It is notable also that all of these barangays with high degree of impact have also low adaptive capacity because of no insurance coverage and no capacity and willingness to retrofit or relocate or conform with the new regulations with makes these barangays vulnerable given the fact that these areas are pre-identified to have moderate to very high susceptibility to flood. While there is high degree of impact and low adaptive capacity, these barangays still have chance to improve because the barangay have available alternate sites, available government resources at their disposal and are empowered to implement zoning regulations.

The table below shows the Climate Change Vulnerability Assessment for Flood which enumerates the technical findings per land use category per barangay. Implications per type of land use describe the consequences of damage due to flood. Policy interventions are also in place in order to mitigate impacts and raise the adaptive capacity of urban use areas during the onslaught of the hazard.

Table U-22. Climate Change Vulnerability Assessment Matrix for Flood, Davao City

Barangay	Land Use Category	Technical Findings	Implications	Policy Interventions
1-A	Residential	<ol style="list-style-type: none"> 1. Area per land Use Category: 6.95; 2. Exposed Area in Hectares: 6.94: 3. % Exposure: 0.998561151079137 4. Exposed Value (PHP): 69400000 5. Degree of Impact: 3 6. Adaptive Capacity: 3 7. Vulnerability Index: 9 8. Vulnerability Category : HIGH 	Light, salvageable materials used in the construction of the houses of informal settlers may get washed away when there are heavy floods	For titled properties, strict implementation of the zoning ordinance for structures within flood prone zone i.e. construction of at least 2-storey structures only must be followed and the 30-meter buffer zone
1-A	Commercial	<ol style="list-style-type: none"> 1. Area per Land Use Category in Hectares: 1.41 2. Exposed Area in Hectares: 1.02 3. % Exposure: 0.723404255319149 4. Exposed Value (PHP): 15300000 5. Degree of Impact: 3 6. Adaptive Capacity: 3 7. Vulnerability Index: 9 8. Vulnerability Category : HIGH 	Potential impacts to local economy will be severe due to economic disruption affecting commercial establishments	Imposition of hazard resistant design standard regulations within flood susceptible areas; conduct site specific flood hazard mapping as basis for the establishment of structural design regulation
2-A	Residential	<ol style="list-style-type: none"> 1. Area per Land Use Category in Hectares: 1.62 2. Exposed Area in Hectares: 1.23 3. % Exposure: 0.759259259259259 4. Exposed Value (PHP): 12300000 5. Degree of Impact: 3 6. Adaptive Capacity: 3 7. Vulnerability Index: 9 7. Vulnerability Category : HIGH 	Light, salvageable materials used in the construction of the houses of informal settlers may get washed away when there are heavy floods	For titled properties, strict implementation of the zoning ordinance for structures within flood prone zone i.e. construction of at least 2-storey structures only must be followed and the 30-meter buffer zone

Map 4.5 Urban Use Areas Vulnerability Map to Flood

LANDSLIDE

There are 69 barangays vulnerable to landslide out of the original 90 barangays which are moderately to highly susceptible to landslide. This same barangays have the highest degree of impact score, which takes up 21.4% of the total allotted residential area of 69 barangays mentioned. These barangays are also those included in areas with low adaptive capacity. The low adaptive capacity is attributed to the high level of no access/area coverage to infrastructure related hazard mitigation measures of the area.

The table below shows the Climate Change Vulnerability Assessment for Landslide which enumerates the technical findings per land use category per barangay. Implications per type of land use describe the consequences of damage due to flood. In order to mitigate impacts and raise the adaptive capacity of urban use areas during the onslaught of the hazard, various policy interventions are also suggested for consideration.

Table U-24. Climate Change Vulnerability Assessment for Landslide, Davao City				
Barangays	Land Use Category	Technical Findings	Planning Implications	Policy Interventions
GUMALANG	Agri-Industrial	1. Area per Land Use Category in Hectares:21.27 2. Exposed Area in Hectares:2.68 3. % Exposure:0.12599905970851 5. Exposed Value (PHP):402000000 6. Degree of Impact:3 7. Adaptive Capacity:3 8. Vulnerability Index:9 9. Vulnerability Category:High	Damaged access roads affect agri-industrial operation (economic loss); Environmental problem-deforestation & soil erosion on steep slopes.	Concerned gov't. agency to always allocate for immediate rehabilitation of roads affected by landslides; Promote reforestation on steep slopes.
MALAGOS	Agri-Industrial	1. Area per Land Use Category in Hectares:7.18 2. Exposed Area in Hectares:0.43 3. % Exposure:0.0598885793871866 4. Exposed Value (PHP):64500000 5. Degree of Impact:3 6. Adaptive Capacity:3 7. Vulnerability Index:9 8. Vulnerability Category:High	Damaged access roads affect agri-industrial operation (economic loss); Environmental problem-deforestation & soil erosion on steep slopes.	Concerned gov't. agency to always allocate for immediate rehabilitation of roads affected by landslides; Promote reforestation on steep slopes.
GATUNGAN	Agri-Industrial	Area per Land Use Category in Hectares:2.17 Exposed Area in Hectares:2.17 Exposure:1 Exposed Value (PHP):325500000 Degree of Impact:3 Adaptive Capacity:3 Vulnerability Index:9 Vulnerability Category:High	Damaged access roads affect agri-industrial operation (economic loss); Environmental problem-deforestation & soil erosion on steep slopes.	Concerned gov't. agency to always allocate for immediate rehabilitation of roads affected by landslides; Promote reforestation on steep slopes.
MAHAYAG	Agri-Industrial	1. Area per Land Use Category in Hectares:26.18 2. Exposed Area in Hectares:6.41 3. % Exposure:0.244843391902215 4. Exposed Value (PHP):961500000 5. Degree of Impact:3 6. Adaptive Capacity:3 7. Vulnerability Index:9 8. Vulnerability Category:High	Damaged access roads affect agri-industrial operation (economic loss); Environmental problem-deforestation & soil erosion on steep slopes.	Concerned gov't. agency to always allocate for immediate rehabilitation of roads affected by landslides; Promote reforestation on steep slopes.

LIQUEFACTION

According to the presented result from the urban use assessment for vulnerability, only the residential area in 79 barangays have high vulnerability to storm surge. Based on the table, these barangays have “low rating” on structure employing hazard resistant/adaptation design and a “very high” rating on no access/area coverage to infrastructure related hazard mitigation. While this is the reality among the structures, findings also disclose that 40 barangays have “high” to “very high” rating on the proportion of buildings with walls with light to salvageable materials and this number also equals to number of barangays with “high” to “very high” proportion of buildings in dilapidated/condemned condition. What makes this barangays an area of concern to liquefaction is that the same barangays have low adaptive capacity, having no capacity and willingness to retrofit or relocate or conform to new regulations and no insurance coverage. Hence, the presence of liquefaction hazard can further be addressed by implementation of zoning regulations, identification of alternate sites and utilization of government resources.

The table below shows the Climate Change Vulnerability Assessment for Liquefaction which enumerates the technical findings per land use category per barangay. Implications per type of land use describe the consequences of damage due to flood. In order to mitigate impacts and raise the adaptive capacity of urban use areas during the onslaught of the hazard, various policy interventions are also suggested for consideration.

Table U-26. Climate Change Vulnerability Assessment for Liquefaction, Davao City

FAULTLINE

Of the total of 46 barangays susceptible to fault line, four (4) are highly vulnerable. Residential areas are among the urban use likely to be affected. This is because of the high degree of impact in residential areas in the proportion of buildings with walls with light to salvageable materials and in proportion of buildings in dilapidated/ condemned condition. These areas also have “moderate” rating on the “structure employing hazard resistant/adaptation design” and in “no access/area coverage to infrastructure related hazard mitigation measures employing hazard resistant/adaptation’. As to the adaptive capacity, these areas have low adaptive capacity attributed to no insurance coverage and no capacity and willingness to retrofit or conform to new regulations. The imminent danger of strong quakes is posed to incur damage of Php 294,951,425, such could still be prevented by strong implementation of zoning regulations identification of alternative sites and utilization of government resources.

The table below shows the Climate Change Vulnerability Assessment for Fault Line which enumerates the technical findings per land use category per barangay. Implications per type of land use describe the consequences of damage due to flood. In order to mitigate impacts and raise the adaptive capacity of urban use areas during the onslaught of the hazard, various policy interventions are also suggested for consideration.

The table below shows the Climate Change Vulnerability Assessment for Landslide which enumerates the technical findings per land use category per barangay. Implications per type of land use describe the consequences of damage due to flood. In order to mitigate impacts and raise the adaptive capacity of urban use areas during the onslaught of the hazard, various policy interventions are also suggested for consideration.

STORM SURGE

According to the presented result from the urban use assessment for vulnerability, only the residential area in 71 barangays have high vulnerability to storm surge. Based on the table, these barangays have “very high” rating on no access/area coverage to infrastructure related hazard mitigation. While this is the reality among the structures, findings also disclose that 38 barangays have “high” to “very high” rating on the proportion of buildings with walls with light to salvageable materials, equals to number of barangays with “high” to “very high” proportion of buildings in dilapidated/condemned condition and those with no structure employing hazard resistant/adaptation design. These barangays are areas of concern for storm surge because they have low adaptive capacity also to brace the degree of impact that may result to worth Php 90,925,469,601.34 of damage. While currently, these barangays have no capacity and willingness to retrofit or relocate or conform to new regulations and does not have insurance coverage, such hazard impact can be further addressed through implementation of zoning regulations, identification of alternate sites and utilization of government resources.

The table below shows the Climate Change Vulnerability Assessment for Storm Surge which enumerates the technical findings per land use category per barangay. Implications per type of land use describe the consequences of damage due to flood. In order to mitigate impacts and raise the adaptive capacity of urban use areas during the onslaught of the hazard, various policy interventions are also suggested for consideration.

Table U-30. Climate Change Vulnerability Assessment for Storm Surge, Davao City				
Barangays	Land Use Category	Technical Findings	Planning Implications	Policy Interventions
1-A	Residential	1. Area per Land Use Category in Hectares:6.95 2.Exposed Area in Hectares:6.95 3.% Exposure:1 4.Exposed Value (PHP):695000000 5.Degree of Impact:3 6.Adaptive Capacity:3 7.Vulnerability Index:9 8.Vulnerability Category:HIGH	There is immediate need to identify relocation sites to accommodate informal settler families; structural mitigation of buildings and construction of sea walls will be very costly	Strengthen EWS and formulation of contingency plans to prevent fatalities and injuries due to potential changes in tidal pattern during sudden onset of hazards;
2-A	Residential	1. Area per Land Use Category in Hectares: 1.62 2. Exposed Area in Hectares: 1.62 3.%Exposure:99.89% 4.Exposed Value (PHP):161836733.90 5.Degree of Impact:3 6. DISASTER RISK ASSESSMENT

EXPOSURE

FLOOD

In disaster risk assessment, only hazards with history of occurrence in the city are considered. This assessment was accomplished by analysing the frequency of disasters throughout the years based on the data of the City Social Welfare and Development Office. This frequency of disasters is reflected through the likelihood of occurrence rating, which is measured through the following scores: 6 – frequent, which happens every 1 to 3 years; 5 – moderate, occurs every 3 to 10 years; 4 – occasional, happens every 10 to 30 years; 3 – improbable, every 30-100 years; 2 – rare event, every 100-200 years; and 1- very rare event which happens every 200 years. It can be noted that for the purpose of this study only hazards such as flood and landslide which have history of occurrence in the city is assessed. The other hazards such as storm surge, active fault and liquefaction were not included.

The table below shows 53 barangays which registered the score of six (6), most of which are residential in use followed by industrial, and third as commercial.

At least 36 barangays scored five (5), 52 are rated four (4), and three (3) barangays are rated at 3.

LANDSLIDE

In considering exposure to hazard, likelihood of occurrence is taken into consideration. This is measured through the following scores: 6 – frequent, which happens every 1 to 3 years; 5 – moderate, occurs every 3 to 10 years; 4 – occasional, happens every 10 to 30 years; 3 – improbable, every 30-100 years; 2 – rare event, every 100-200 years; and 1- very rare event which happens every 200 years.

Barangays Tapak, Matina Crossing, and Matina Pangí are the top three in terms of having the highest likelihood of occurrence of landslide with a score of six (6). For barangay Tapak the exposed area is used as residential while those of barangay Matina Crossing are for industrial, residential, and commercial use; and for barangay Matina Pangí, the areas are utilized for commercial, parks and recreation, tourism, residential, and industrial use.

CONSEQUENCE ESTIMATION

FLOOD

Severity of consequence is measured as follows: very high (VH), 4, means >40% non-residential structures are severely damaged or 20% of residential structures are severely damaged; high (H), 3, is when >20 to 40% non-residential based structures area severely damaged or 10 to 20% residential structures are severely damaged; moderate (M), 2, is when 10 to 20% of non-residential structures are severely damaged or 5 to 10% of dwelling units are severely damaged; and low (L), 1, is when production based structures are < 10% or < 5% of dwelling units are severely damaged.

Out of the 76 barangays affected by flood in the residential area, 57 barangays are assessed to have the highest severity of consequence when flood-induced damages incur in the area. These identified barangays have a total area of 3,940.11 hectares with a portion of 29.7% as an area wherein has most severe damage to residential structures.

Table U-33. Urban Use Area Severity of Consequence Estimation, Flood, Davao City

LANDSLIDE

Severity of consequence is measured as follows: very high (VH), 4, means >40% non-residential structures are severely damaged or 20% of residential structures are severely damaged; high (H), 3, is when >20 to 40% non-residential based structures area severely damaged or 10 to 20% residential structures are severely damaged; moderate (M), 2, is when 10 to 20% of non-residential structures are severely damaged or 5 to 10% of dwelling units are severely damaged; and low (L), 1, is when production based structures are < 10% or < 5% of dwelling units are severely damaged.

The 79 affected barangays in the residential area were found to have an average of 24.2% expected damaged residential structure brought about by landslide which is categorized as a high severity of consequence based from the severity of consequence score matrix (NDCC Memorandum Order No. 4, Series of 1998).

RISK ESTIMATION

FLOOD

Risk estimation is determined by multiplying the likelihood of occurrence and severity of consequence scores as shown in the previous tables and discussions.

Based on the above figure, the 41 exposed barangays to flood in the residential area were assessed to accumulate an area of 2,513.17 hectares in which 40.43% of it is, as per severity of consequence matrix, categorized at the high level. The former statement further supported the idea as results found that the area has lowest adaptive capacity, highest degree of impact, and highest vulnerability to flood among the urban use areas. The table below shows urban use areas with low to high flood risk.

Table U-35. Urban Use Areas Risk to Flood, Davao City

Barangay	Land Use Category	HAZARD			EXPOSURE					VULNERABILITY				Severity of Consequence	RISK	
		Flood Susceptibility	Likelihood of Occurrence Score	Expected Flood Depth	Total Brgy. Area Allocation in Hectares	Replacement Cost per sq. meter (PHP)	Affected Area in Hectares (GIS Derived)	Affected Value (PHP)	% Exposure	Proportion of buildings with walls with light to salvageable materials	Proportion of Buildings in dilapidated/ condemned Condition	Structure Employing Hazard Resistant/ Adaptation Design	Structures No access/ area coverage to infrastructure related hazard mitigation measures		Risk Score	Risk Category
							HxGx10000	H/F						=SxD

Decision areas for Flood

There is a total of 24 barangays which are highly recommended to have hazard mitigation measures in terms of flood. Out of these barangays Maa has the highest number of hectares at risk to flood. It has 193 ha of urban spaces are at high risk to flood, 71% is residential area, 14% is commercial, 9% industrial, 3% parks and recreation, and 3% tourism. Aside from Ma-a, Calinan should also be highly considered because 129.64 ha is at high flood risk, 83% is residential area, 15% commercial, 2% industrial, 1% parks and recreation. Barangays Matina-Aplaya, Bucana, 8-A, 19-B, Bunawan, Los Amigos and Bago Gallera are also among the areas with high number of hectares at risk to flood with 87.13 has, 86.72 has, 56.07 has, 45.47 has, 66.74 has, 43.59 has, and 49.64 has of high flood risk areas, respectively.

LANDSLIDE

Based on the above figure, the 90 exposed barangays to landslide have a high severity of consequence with a moderate likelihood of occurrence to landslide and a low adaptive capacity, thus, concludes that the residential area exposed to landslide is a high risk area. Reflected in the table below are areas with moderate to high landslide risk.

Table U-37. Urban Use Areas Risk to Landslide, Davao City

		HAZARD	EXPOSURE					VULNERABILITY				Severity of Consequence	RISK	
Barangay	Land Use Category	Likelihood of Occurrence Score	Total Brgy. Area Allocation in Hectares	Replacement Cost per sq. meter (PHP)	Affected Area in Hectares (GIS Derived)	Affected Value (PHP)	% Exposure	Proportion of buildings with walls with light to salvageable materials	Proportion of Buildings in dilapidated/condemned Condition	Structure Employing Hazard Resistant/Adaptation Design	Structures No access/area coverage to infrastructure related hazard mitigation measures		Risk Score	Risk Category

Decision Areas for Landslide Risk

A total of barangays of the city have urban use areas at risk to landslide. Out of these barangays ten (10) are identified to have considerable total number of hectares of urban uses at risk to landslide. These barangays include Ma-a, Panacan, Marilog, Buhangin, Tigatto, Matina Pangi, Salaysay, Tapak, Matina Crossing and Talomo.

Table U-38 Urban Use Risk Assessment for Landslide Summary Matrix, Davao City

Barangay	Existing Land Use	TECHNICAL FINDINGS	IMPLICATIONS	POLICY INTERVENTIONS
19-B	Residential	1. Area is 179.82 has; 2. Exposed Area is 1.32 3. Percentage of Exposure 0.73 % 4. Replacement Cost is 10,000 5. Exposed Value is 132,000,000.00	Residential houses in the damaged slopes are always at risk for further sliding; Displacement of houses specifically those owned by informal settlers.	LGU to provide proper evacuation plan and integrated emergency management mechanism to communities; Educate residents on natural warning signs & the severity of disasters; LGU to regulate illegal construction of houses on steep slopes.
19-B	Commercial	1. Area is 28.23 has; 2. Exposed Area is 1.86 ha 3. Percentage of Exposure 6.59% 4. Replacement Cost is 15,000 5. Exposed Value is 279,000,000.00	Damaged structures entails financial instability of the businesses of small entrepreneurs; Discourages future investors.	Concerned agencies to require mitigating measure plan to building permit applicants for projects within landslide prone areas; Encourage structure owners to secure building insurances.
CARMEN	Residential	1. Area is 1.49 has; 2. Exposed Area is 1.26 ha 3. Percentage of Exposure 84.56% 4. Replacement Cost is 10,000 5. Exposed Value is 126,000,000.00	Residential houses in the damaged slopes are always at risk for further sliding; Displacement of most houses made of light salvageable materials.	LGU to prepare comprehensive guidelines especially on groundwater & surface water management during heavy rainfall w/c will be needed to protect people from massive landslide on any slope.
TAMBOBONG	Residential	1. Area is 4.49 has; 2. Exposed Area is 4.49 ha 3. Percentage of Exposure 100% 4. Replacement Cost is 10,000 5. Exposed Value is 449,000,000.00	Residential houses in the damaged slopes are always at risk for further sliding; Displacement of houses specifically those owned by informal settlers.	LGU to conduct census tagging along landslide prone areas at the earliest possible time and relocate qualified beneficiaries;
BUHANGIN	Residential	1. Area is 335.29 has; 2. Exposed Area is 36.71 ha 3. Percentage of Exposure 10.95% 4. Replacement Cost is 10,000 5. Exposed Value is 3,671,000,000.00	Poor housing infrastructures in the damaged slopes are always at risk for further sliding; Displacement of most houses made of light salvageable materials.	LGU to conduct census tagging along landslide prone areas at the earliest possible time and relocate qualified beneficiaries to their safe dwellings;

Table U-38 Urban Use Risk Assessment for Landslide Summary Matrix, Davao City

Barangay	Existing Land Use	TECHNICAL FINDINGS	IMPLICATIONS	POLICY INTERVENTIONS
BUHANGIN	Cemetery	1. Area is 8.84 has; 2. Exposed Area is 7.54 ha 3. Percentage of Exposure 85.29% 4. Replacement Cost is 15,000.00 5. Exposed Value is 1,131,000,000.00	Loss of public memorial park. Burden to the public who can not afford high end private memorial parks.	Rehabilitation support through immediate replacement of lost or damaged land and facilities.
BUHANGIN	Industrial	1. Area is 4.4 has; 2. Exposed Area is 2.45 ha 3. Percentage of Exposure 55.68% 4. Replacement Cost is 15,000.00 5. Exposed Value is 367,500,000.00	Structural damage to industrial facilities may cause major economic damage.	Government to provide structural mitigating measures such as drainage, erosion protection, vegetation, ground improvement, retaining walls/ structures at the affected areas.
BUHANGIN	Parks and Recreational	1. Area is 0.96 has; 2. Exposed Area is 4.49 ha 3. Percentage of Exposure 100% 4. Replacement Cost is 10,000 5. Exposed Value is 449,000,000.00	Loss of public spaces for parks and recreation which are usually not enough for the surrounding communities.	Rehabilitation support through immediate replacement of lost or damaged land and facilities.
CALLAWA	Residential	1. Area is 7.9 has; 2. Exposed Area is 0.68 ha 3. Percentage of Exposure 8.61% 4. Replacement Cost is 10,000 5. Exposed Value is 68,000,000.00	Residential houses in the damaged slopes are always at risk for further sliding; Displacement of houses specifically those owned by informal settlers.	LGU to provide proper evacuation plan and integrated emergency management mechanism to communities; Educate residents on natural warning signs & the severity of disasters; LGU to regulate illegal construction of houses on steep slopes.
TIGATTO	Residential	1. Area is 256.29 has; 2. Exposed Area is 39.43 ha 3. Percentage of Exposure 15.38% 4. Replacement Cost is 10,000 5. Exposed Value is 3,943,000,000.00	Residential houses in the damaged slopes are always at risk for further sliding; Displacement of houses specifically those owned by informal settlers.	LGU to provide proper evacuation plan and integrated emergency management mechanism to communities; Educate residents on natural warning signs & the severity of disasters; LGU to regulate illegal construction of houses on steep slopes.
TIGATTO	Industrial	1. Area is 13.02 has; 2. Exposed Area is 7.17 ha 3. Percentage of Exposure 55.07% 4. Replacement Cost is 10,000 5. Exposed Value is 1,075,500,000.00	Structural damage to industrial facilities may cause major economic damage.	Government to provide structural mitigating measures such as drainage, erosion protection, vegetation, ground improvement, retaining walls/ structures at the affected areas.

Table U-38 Urban Use Risk Assessment for Landslide Summary Matrix, Davao City

Barangay	Existing Land Use	TECHNICAL FINDINGS	IMPLICATIONS	POLICY INTERVENTIONS
BUNAWAN	Industrial	1. Area is 115.6 has; 2. Exposed Area is 11.07ha 3. Percentage of Exposure 9.58%% 4. Replacement Cost is 15,000.00 . 5. Exposed Value is 1,660,500,000.00	Structural damage to industrial facilities may cause major economic damage.	Government to provide structural mitigating measures such as drainage, erosion protection, vegetation, ground improvement, retaining walls/ structures at the affected areas.
BUNAWAN	Residential	1. Area is 123.76 has; 2. Exposed Area is 7.75ha 3. Percentage of Exposure 6.26%% 4. Replacement Cost is 10,000.00 5. Exposed Value is 775,000,000.00	Residential houses in the damaged slopes are always at risk for further sliding; Displacement of houses specifically those owned by informal settlers.	LGU to provide proper evacuation plan and integrated emergency management mechanism to communities; Educate residents on natural warning signs & the severity of disasters; LGU to regulate illegal construction of houses on steep slopes.
PANACAN	Residential	1. Area is 256.99 has; 2. Exposed Area is 67.73 has; 3. Percentage of Exposure is 0.263551110938169; 4. Replacement Cost is 10000; 5. Exposed Value is 6773000000	Residential houses in the damaged slopes are always at risk for further sliding; Displacement of houses specifically those owned by informal settlers.	LGU to provide proper evacuation plan and integrated emergency management mechanism to communities; Educate residents on natural warning signs & the severity of disasters; LGU to regulate illegal construction of houses on steep slopes.
PANACAN	Industrial	1. Area is 120.37 has; 2. Exposed Area is 21 has; 3. Percentage of Exposure is 0.174462075267924; 4. Replacement Cost is 15000; 5. Exposed Value is 3150000000	Structural damage to industrial facilities may cause major economic damage.	Government to provide structural mitigating measures such as drainage, erosion protection, vegetation, ground improvement, retaining walls/ structures at the affected areas.
SAN ISIDRO	Residential	1. Area is 26.46 has; 2. Exposed Area is 3.4 has; 3. Percentage of Exposure is 0.128495842781557; 4. Replacement Cost is 10000; 5. Exposed Value is 340000000	Residential houses in the damaged slopes are always at risk for further sliding; Displacement of houses specifically those owned by informal settlers.	LGU to provide proper evacuation plan and integrated emergency management mechanism to communities; Educate residents on natural warning signs & the severity of disasters; LGU to regulate illegal construction of houses on steep slopes.
SAN ISIDRO	Industrial	1. Area is 4.21 has; 2. Exposed Area is 0.01 has; 3. Percentage of Exposure is 0.00237529691211401; 4. Replacement Cost is 15000; 5. Exposed Value is 1500000	Structural damage to industrial facilities may cause major economic damage.	Government to provide structural mitigating measures such as drainage, erosion protection, vegetation, ground improvement, retaining walls/ structures at the affected areas.

Integrated Major Decision Areas

The Integrated Major Decision Areas, categorized into Major Decision Area-1 (MDA-1), Major Decision Area-2 (MDA-2), and Major Decision Area-3 (MDA-3), summarizes the priority areas for intervention of the local government in terms of policies and projects in the next ten (10) years as a result of the Climate Disaster and Risk Assessment made, based on the five (5) exposed elements: Population, Critical Point Facilities, Lifeline Utilities, Natural Resource-Based Production Area and Urban Use.

After the assessment, Suawan, Matina Crossing, Talomo, Marilog, Tigatto, Ma-a, Matina Pangi, Panacan, Tamugan, Calinan, 19-B, Mintal, Tugbok, Bunawan, Bucana, Matina Aplaya were identified as Integrated Major Decision Areas-1. MDA-1 are the top priority areas for immediate attention, and implementation of risk mitigation projects and programs.

On the other hand, Buhangin, Leon Garcia Sr., 8-A, Los Amigos, Malabog and Salaysay are identified as Integrated Major Decision Areas-2. These barangays are the second highest priority, while barangays 1-A, 2-A,5-A, 21-C, 22-C, 23-C, 31-D, Centro, Waan, Lasang, Bago Aplaya, Catalunan Pequeño are identified as Integrated Major Decision Areas-3, the third highest in priority for risk and disaster mitigation projects.
