CRITICAL POINT FACILITIES

The extension of social services relies on facilities which are considered to be essential in the daily lives of people in the localities. This section will cover the information on critical point facilities, their vulnerability, and adaptive capacity for every exposure attribute.

The succeeding tables display the exposure of critical facilities such as barangay halls, barangay health stations, day care centers, elementary and secondary schools, police outposts, police sub-stations, and fire stations to flood, landslide, storm surge, and liquefaction.

The number and type of affected facilities vary for every exposure attribute. Of the four, the occurrence of liquefaction will affect the biggest number of facilities, at 405, in various barangays, followed by 385 facilities exposed to landslide, while 310 and 285 are exposed to storm surge and flood, respectively.

FLOOD

The data gathered show that 285 facilities are exposed to flood in varying degrees. The effect of the occurrence of flood will depend on the existing condition of the structures, thus, the gauge of the sensitivity of every structure may already be determined. Out of the total number of 285 facilities, two day care centers located in Calinan and El Rio, Barangay 19-B are in critical condition, and one day care in Lapu-Lapu, Agdao is already dilapidated. Commonly, day care centers are one-storey structures. As for the others, 13 structures are in poor condition, 81 need repair, 46 fair, and 142 structures are considered in good condition.

More than half, or 167 of facilities have employed hazard resistant design and the remaining 118 are still in need of retrofitting or other alternatives that can improve the resiliency of the structures

Table CP-1. Critical Point Facilities Exposure to Flood, Davao City

Barangay	Facility Type	Name	Storeys	Area (sq. m)	Capacity (Classroom, Bed, Capacity, Loading Capacity)	Wall Materials used	Existing Condition	Structure Employing Hazard Resistant Design

Map 3.1 Critical Point Facilities Exposure Map to Flood, Davao City

STORM SURGE

There are 310 critical point facilities which have been determined to be exposed to the occurrence of storm surge. The table below presents the details of the type of facilities exposed, their existing condition, among others. The data show that there are four (4) facilities in critical condition, namely: two (2) daycare centers in Barangay 15-B, Poblacion, and Matina Aplaya; and two-storey fire station in Paciano Bangoy and Matina Crossing. There are 153 facilities determined to be in good condition, while 68 are considered to be in fair condition, 25 in poor condition, and 57 need to be repaired.

There are 214 structures that are to be reinforced with hazard resistant design while the remaining 96 have already been employed with hazard resistant design.

Map 3.2 Critical Point Facilities Exposure Map to Storm Surge, Davao City

LANDSLIDE

Critical point facilities exposed to landslide total to 358 wherein 214 have not been fitted with hazard resistant design. Sixty-four (64) are already retrofitted or employed designs that reinforced the design of the structure to increase its adaptive capacity in the occurrence of landslides.

Most of the facilities or 160 are found to be in good condition, 135 facilities need repair, 39 in fair condition, and 20 are in poor condition, thus susceptible to landslides in the areas where the structures are located.

Map 3.3 Critical Point Facilities Exposure Map to Landslide, Davao City

LIQUEFACTION

The total number of critical point facilities susceptible to liquefaction reach 405 and of the total number, three (3) are in critical condition namely: a day care center in Barangay 15-B, Poblacion, another day care center in Matina Aplaya, and a 2-storey fire station in Paciano Bangoy. A big number of 227 facilities are in good condition while 80 structures need repair. The rest, or 67, are in fair condition, and 28 are in poor condition.

There are 293 structures that are not designed employing hazard resistant means, while 112 facilities have been retrofitted or have adopted other alternatives to improve its condition and degree of susceptibility.

Map 3.4 Critical Point Facilities Exposure Map to Active Fault Line & Liquefaction, Davao City

DEGREE OF IMPACT RATING

Every structure identified in the succeeding tables have been determined to be exposed to different elements in varying extent and it is necessary to estimate the degree of the impact to critical point facilities. Information gathered will give the City Government of Davao a clearer picture of how much damage every element can do to exposed facilities which will facilitate the determination of cost, intervention, and resources necessary to improve existing structures.

FLOOD

There are 16 structures that are estimated to have impact scores of 3 or high in terms of degree of impact once flooding will take place. None of said structures employed hazard resistant design contributing to its rate of sensitivity to flood. The facilities having an impact rating of 3 are barangay health stations (6), police outposts (5), (3) day care centers, (1) barangay hall, and (1) fire station.

Table CP-5. Critical Point Facilities, Degree of Impact Rating to Flood, Davao City

ADAPTIVE CAPACITY

The adaptive capacity of critical point facilities is determined for every hazard exposure. The facilities affected will be measured in terms of its flexibility to take in changes in the climate. The tables below show the degree of adaptive capacity of critical point facilities upon its exposure to flood, storm surge, landslide, and liquefaction. The higher the adaptive capacity score, the lesser flexibility there is in every facility to accommodate changes in the climate which entails more cost to the City Government and other related agencies to cope with the effects caused by the onslaught of hazards.

FLOOD

There are 285 structures identified to be exposed that are exposed to flood and of the total number, 143 bear the adaptive capacity of 1, which is considered to have a high adaptive capacity while 139 have a score of 2 or moderate and 3 structures receive the rating of 3 or low. These critical point facilities with low adaptive capacity are all single-storey day care centers located at Barangays 19-B, Lapu-Lapu, and Calinan. These three structures should avail resources from the government to mitigate impacts of flooding when the same occurs in the area.

Table CP-9. Critical Point Facilities, Adaptive Capacity to Flood, Davao City

Barangay Code	Barangay	Facility Type	Name	Area (sq. m)	Degree of Impact	Insurance Coverage	Avail Local Government Resources	Adaptive Capacity Score

STORM SURGE

Of the 310 critical point facilities identified to be susceptible to landslide, 184 are given the adaptive capacity of 1, while 107 facilities have moderate of adaptive capacity to take in change in the climate, while there are 19 with low capacity to adopt to impacts of climate change. The 19 structures are barangay halls (3), day care centers (6), elementary schools (8), and secondary schools (2). These structures are not covered by property damage insurance, thus, should consider adopting mitigating measures since these structures were also have a high degree of impact in the occurrence of storm surge in the areas where these are located.

LANDSLIDE

The number of critical point facilities susceptible to landslide total to 358 where 57 have high adaptive capacity, 267 facilities are determined to have moderate adaptive capacity, and 34 structures with low adaptive capacity. Of the 33 structures, 32 are day care centers and one barangay hall. These structures with low adaptive capacity do not have insurance coverage and no resources to mitigate the effects of landslide. Most of the 33 structures have high degree of impact, which implies fatalities in the event landslides will take place.

Table CP-11. Critical Point Facilities, Adaptive Capacity to Landslide, Davao City

Barangay Code	Barangay	Facility Type	Name	Area (sq. m)	Degree of Impact	Insurance Coverage	Available Local Government Resources	Adaptive Capacity Score
03006	TAMBO-BONG	Barangay Hall	Tambobong Brgy. Hall	184.667	1	The structure of the barangays halls has no insurance coverage	LGU has no available resources for retrofitting and relocation. However, funds can set and sourced through DRRM fund.	1

LIQUEFACTION

There are 405 critical point facilities susceptible to liquefaction, 216 have high adaptive capacity, 175 moderate, and 14 are given the score of low. The 14 structures are barangay halls (3), barangay health stations (5), day care centers (3), elementary schools (2), and a secondary school. These structures are not covered by insurance. As to the improvement of the structure so as to increase its adaptive capacity, funds for retrofitting can be sourced from the disaster risk reduction and management fund of the city government.

Table CP-12. Critical Point Facilities, Adaptive Capacity to Liquefaction, Davao City

Barangay Code	Barangay	Facility Type	Name	Area (sq. m)	Degree of Impact	Insurance Coverage	Available Local Government Resources	Adaptive Capacity Score
01001	1-A	Barangay Hall	1-A Brgy. Hall	87.28	3	The structure of the barangays halls has no insurance coverage	LGU has no available resources for retrofitting and relocation. However, funds can set and sourced through DRRM fund.	1

VULNERABILITY

In the assessment of the degree of vulnerability of critical point facilities in the onslaught of hazards, the determination of the vulnerability index will give the City Government of Davao the capability to determine the appropriate interventions to be infused in improving the conditions of the facilities. Moreover, the LGU will be provided with the data necessary for the identification of structures that are in urgent need of assistance.

FLOOD

The table shows the vulnerability categories of critical point facilities exposed to flood based on the vulnerability index. A qualitative equivalent indicates the vulnerability category which describes the state of every facility. There are only 3 facilities under the “high” category which can be interpreted as structures where expected impact of the flooding hazard is high and said structures have low capacity to take in said impacts. The structures are day care centers in Barangay Lapu-Lapu, Calinan, and 19-B.

Table CP– 13. Critical Points Facilities Vulnerability, Flood Impact Areas

Barangay	Facility Type	Name	Area (sq. m)	Degree of Impact	Adaptive Capacity Score	Vulnerability Index	Vulnerability Category

Map 3.5 Critical Points Facilities Vulnerability Map to Flood, Davao City

STORM SURGE

There are 19 critical point facilities with high vulnerability to storm surge, which are barangay halls (3), day care centers (6), elementary schools (8), secondary schools (2). These structures have high vulnerability and low adaptive capacity in the occurrence of storm surge in their respective areas wherein the degree of impact is foreseen to be fatal to the structures.

Table CP– 14. Critical Points Facilities Vulnerability, Storm Surge Impact Areas

Barangay	Facility Type	Name	Area (sq. m)	Degree of Impact	Adaptive Capacity Score	Vulnerability Index	Vulnerability Category

Map 3.6 Critical Points Facilities Vulnerability Map to Landslide, Davao City

LIQUEFACTION

Only Sta. Ana Central Elementary School in Barangay 28-C, Poblacion is categorized under “high” in terms of vulnerability wherein it has low adaptive capacity to accommodate the impact of change in climate or in the occurrence of liquefaction within the area.

Table CP– 16. Critical Points Facilities Vulnerability, Liquefaction Impact Areas

Map 3.7 Critical Point Facilities Vulnerability Map to Active Fault Line & Liquefaction, Davao City

CONSEQUENCE ANALYSIS

The exposure of critical point facilities to various hazards is further analysed by assigning severity of consequence scores to classify structures into categories in terms the degree of damage and disruption of delivery of services and/or operations after the occurrence of hazards, particularly, Flood and Landslide. These categories are Very High wherein damages may lead to the disruption of services which may last one week or more; High when damages may lead to the disruption of services which may last three days to less than a week; Moderate when damages may lead to the disruption of service lasting for one day to less than three days, and Low wherein daages may lead to the disruption of service lasting less than one day.

FLOOD RISK ASSESSMENT

There are 110 structures in the table below that are susceptible to flood wherein 15 are under the category of very high which are day care centers (2), elementary school (1), and police outposts/sub-stations (12) these structures do not employ hazard resistant designs making the same vulnerable when exposed to flood, hence the increased severity of consequence scores.

Table CP– 17. Flood Risk to Critical Point Facilities

Barangay	Facility Type	HAZARD			EXPOSURE			VULNERABILITY			SEVERITY OF CONSEQUENCE	RISK	
		Flood Susceptibility	Likelihood of Occurrence Score	Expected Flood Depth	Storey	Area	Number of Classroom/ Rooms/ Bed Capacity	Wall Materials used	Existing Condition	Structure Employing Hazard Resistant Design		Risk Score	Risk Category
1-A	day care center	HSA	3	< 1 meter	1	80	1 classroom	concrete	fair	No	2	6	Moderate
	Barangay Hall	HSA	3	< 1 meter	2	57.94	N/A	mixed	fair	no	3	9	Moderate

LANDSLIDE RISK ASSESSMENT

The table below shows 223 structures are susceptible to landslide. Of the total number, eight (8) are under the category of very high in terms of severity of consequence, namely, day care centers (2), barangay health stations (3), elementary schools (2) and one secondary school. These structures need repair and retrofitting to withstand the occurrence of landslide in the area.

Table CP– 18 Landslide Risk to Critical Point Facilities

Barangay	Facility Type	HAZARD	EXPOSURE			VULNERABILITY				SEVERITY OF CONSEQUENCE	RISK	
		Landslide Susceptibility	Likelihood of Occurrence Score	Storey	Area	Number of Classroom/ Rooms/ Bed Capacity	Wall Materials used	Existing Condition	Structure Employing Hazard Resistant Design		Risk Score	Risk Category
19-B	day care center	HSA	5	1	100	1 classroom	concrete	fair	No	2	10	Moderate
Tambobong	Elementary School	HSA	5	1	500	7 classrooms	Mixed	Needs repair	Yes	0	0	High
Tambobong	Elementary School	HSA	5	1	20000	7 classroom	Mixed	Needs repair	Yes	0	0	High
Tambobong	Elementary School	MLSA	5	1	2000	20 classrooms	Mixed	Needs repair	Yes	0	0	High
Tambobong	Secondary School	MLSA	5	1	10000	6 classrooms	Mixed	Needs repair	Yes	0	0	High
Tambobong	BHS	MLSA	5	1	40	N/A	Mixed	Poor	No	4	20	High

MAJOR DECISION AREAS

The exposure of government structures to risks such as flooding and landslide is presented in this chapter. The identified risks cover structures and facilities utilized in the extension of social services thus, the creation of resilient communities will be realized when impacts of disaster are properly mitigated. One option available is by retrofitting of structures situated within areas identified to have an exposure of moderate to high risk to flood and landslide.

The transferring of social services structures will not be recommended since it will take away the access to service from the people in the community. Instead, structures will be refurbished to remain sturdy and withstand the occurrence of disasters at a certain degree in the future.

The table below is a summary of the government structures that are exposed to risks including the level of risks and type of facilities:

Table CP– 19. Summary of Government Structures Exposed to Risk, Davao City

Facility Type	FLOOD			LANDSLIDE		
	No. of Facilities	Risk Category		No. of Facilities	Risk Category	
		Moderate	High		Moderate	High
Barangay Hall	3	1	2	2	1	1
Barangay Health Station	13	10	3	13	10	3

Police Sub-Station	7	0	7			
Secondary School	6	3	3	22	11	11
SIR Fire Station	1	1	0			

Of the total number of police sub-stations, 2 have very high risk exposure to flood belonging to Barangay Tomas Monteverde and Ubalde. Both structures are within urban areas and within Agdao District.

Based on the Climate Change and Disaster Risk Assessment undertaken, the following implications came out in the discussion when flooding occurs and unmitigated:

- Possible delayed response during emergency due to damaged structure
- Potential casualties during flood occurrence
- Potential damage to facilities, buildings and properties
- Disruption of services
- Displacement of students
- Increase in expenditures for repair or construction of facilities

The policy interventions recommended are:

- Rehabilitation and retrofitting of existing structure with hazard resilient design
- Construction of flood control projects like river/ seawalls, riverbank riprapping, and flood control gates and pumping stations
- Regular declogging of canals and other water ways
- Future construction of facilities and buildings should adopt hazard-resilient designs
- Partnership with private and business organization for the construction of flood control projects (Adopt-A-School Program)
- Strengthen community early warning system and disaster-preparedness activity in the community
- Establish service delivery networks

For the structures exposed to landslide, the following implications were arrived at in case landslide occurs in areas where structures are exposed:

- Potential destruction and damage to the facilities if heavy onslaught of landslide occurs.
- Probable delays in emergency response during landslides due to damages in structure.
- Possible disruption of basic services.
- Displacement of pupils.
- Increase in expenditures for repair and construction of facilities.
- Reconstruction and/or retrofitting of existing critical point facility that employs hazard resilient design

To mitigate the implications of the occurrence of landslide, the following policy interventions are recommended:

- Rehabilitation and retrofitting of existing structure that employs hazard resilient design.
- Future construction of critical point facilities should follow standards for hazards resiliency.
- Forging partnerships with private and non-government organizations in construction of new facilities.
- Conduct of Inventory and regular monitoring and evaluation of Critical Point Facilities to assess its structure and resiliency to hazards.

- Strengthen the coordination and service delivery system of agencies and LGU to the affected community.
- Enhance the early warning system and disaster preparedness of the communities.

These policy interventions recommended should be mainstreamed to form part of the city’s major and current efforts to fortify its level of resiliency, most especially, structures that operate as channels of social services that reach out to its people.

Climate and Disaster Risk Assessment

Overview

Davao City's climate has changed through the years just as the Philippines has, being a direct recipient of global climate change phenomenon, necessitating systematic and comprehensive approach to address adaptation and mitigation measures. From experiencing zero typhoons, the city is now feeling, and reeling from, the impact of typhoons and low-pressure areas, resulting in floods, rain-induced landslides, and other geophysical and ecological hazard events.

With frequency of occurrences of these hazards, in Davao City and across Mindanao, the city is embarking on a roadmap to become a center of excellence in climate change adaptation and disaster-resiliency through the conduct of Climate and Disaster Risk Assessment (CDRA). This is pursuant to Republic Act No. 10121 or the National Disaster Risk Reduction and Management Act that mandates the national and local government units to mainstream disaster risk reduction and climate change in development processes. The processes involve policy formulation, socioeconomic development planning, budgeting, and governance, particularly in the areas of environment, agriculture, water, energy, health, education, poverty reduction, land use and urban planning, and public infrastructure and housing, among others.

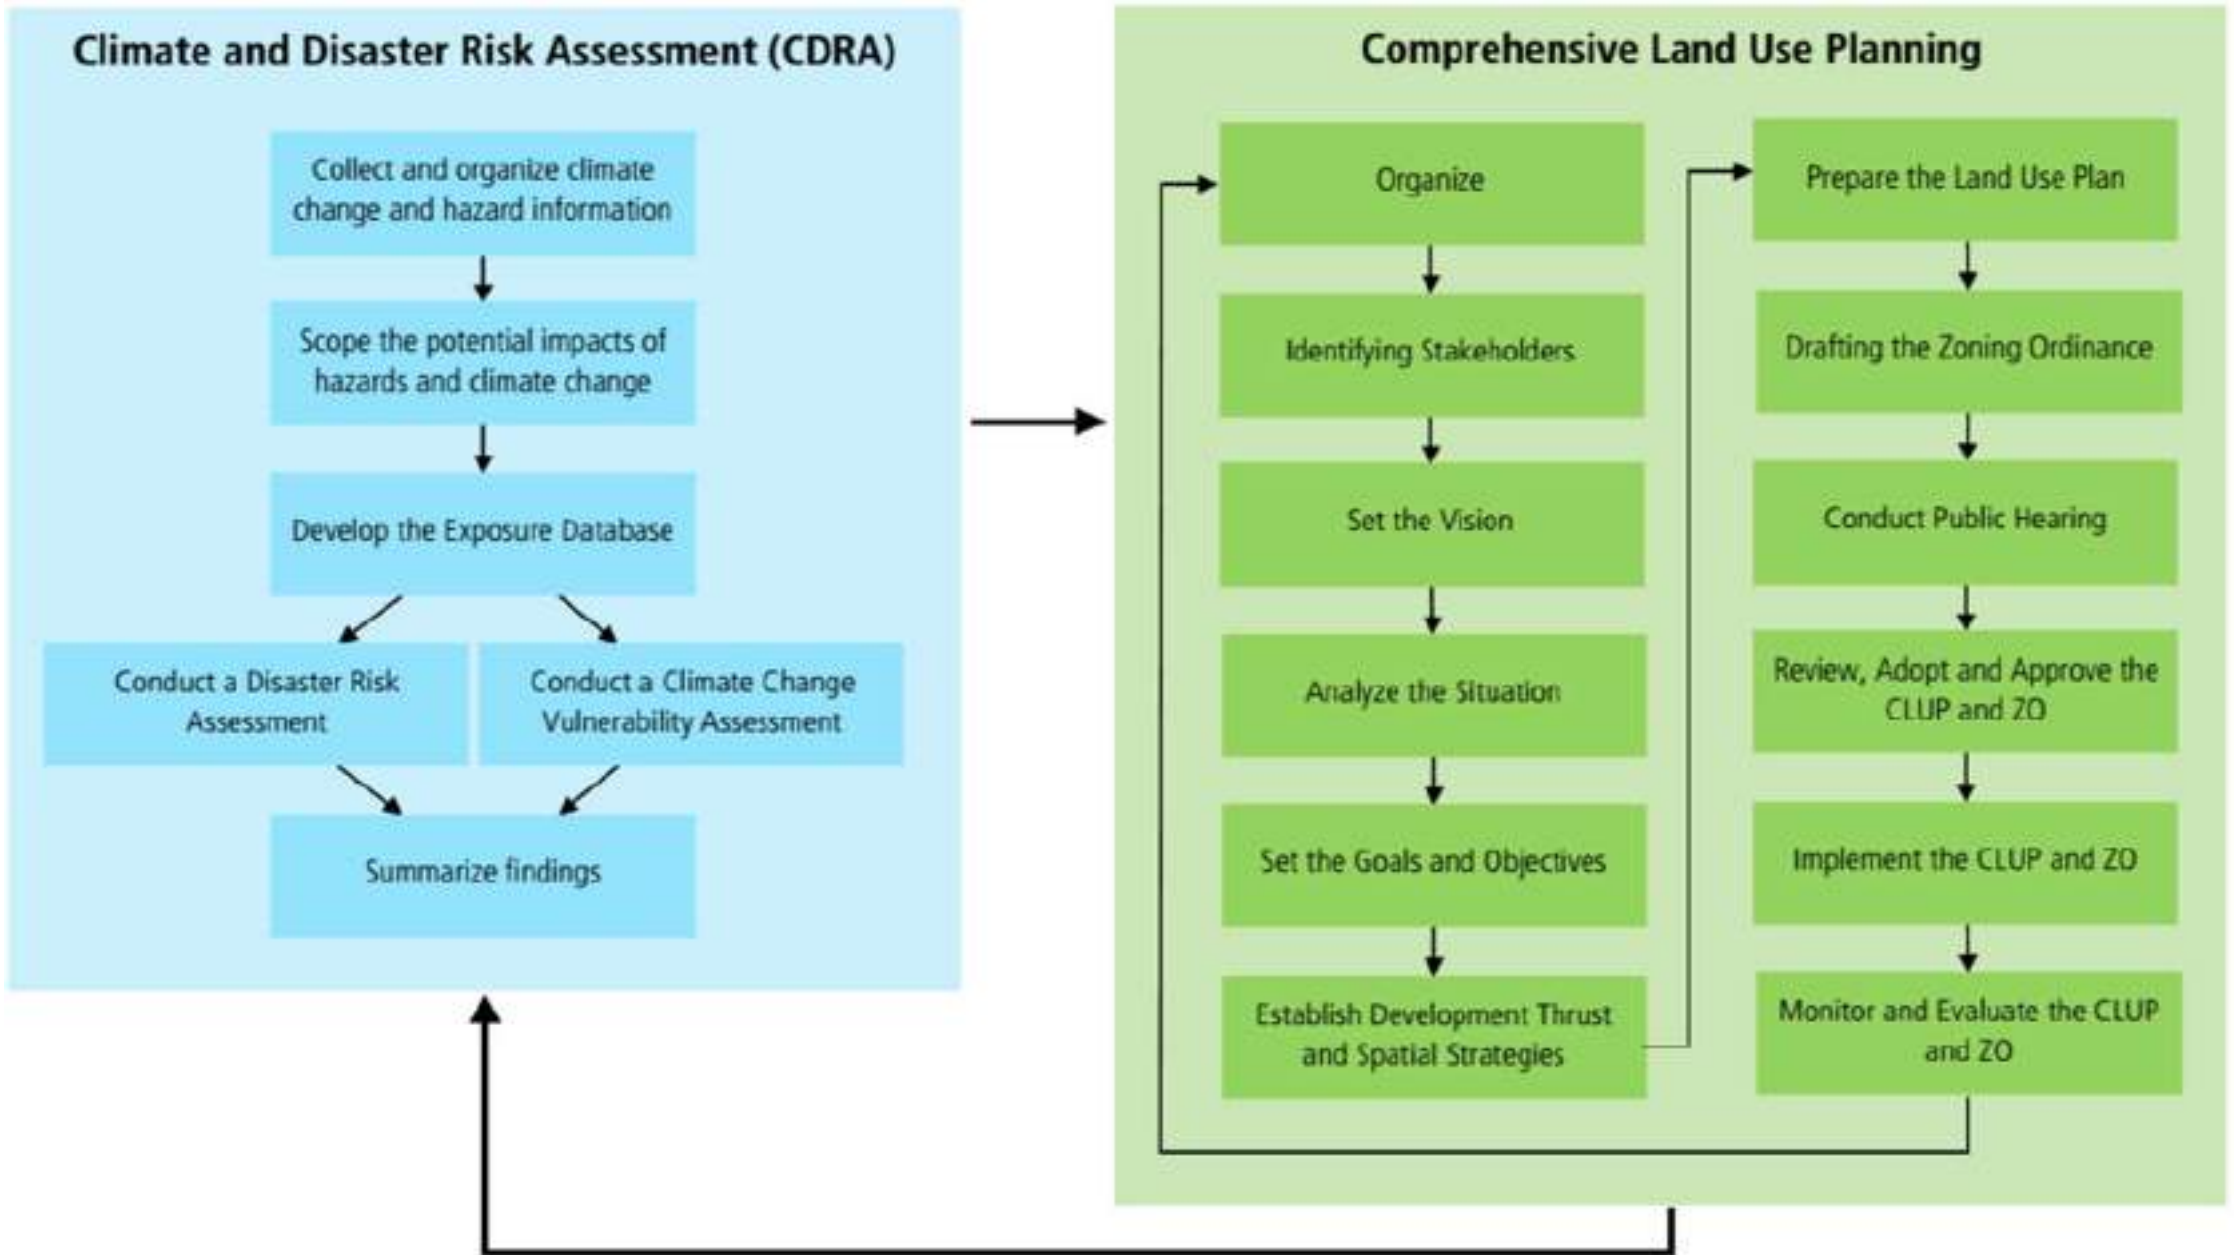

The CDRA is both risk assessment and climate change vulnerability assessment. Risk assessment involves identifying the nature and behaviour of the hazards to which the city is exposed to. Climate Change Vulnerability Assessment (CCVA) is a tool which identifies the vulnerabilities of the locality to the various climate related stimuli.

The combination of assessment tools, CCVA and DRA is used to determine key decision areas for climate change-adaptation and disaster risk-reduction. Both are intended to describe the elements exposed to hazards, identify underlying factors contributing to sensitivities and vulnerabilities, and assess their respective adaptive capacities to establish a measure of risks and vulnerabilities. The information derived from the process shall allow identification of spatial-based intervention policies and strategies to reduce risks and vulnerabilities.

This vital assessment, thus, enables the city government to craft the strategies, policies and regulations to reduce disaster in highly susceptible areas, identify safe areas for future urban development, and distinguish climate adaptation measures for the vulnerable population. All of these are buoyed upon the vision to continually make Davao City as globally liveable.

Under this CCVA and CDRA framework are measurements or estimates on: **degree of impact** of a certain identified climate change event (e.g. landslide, storm surge) to the residents in the place of occurrence, to the government facilities therein, and to the natural and other forms of resources in the place. This maybe measured or estimated as moderate to high; **adaptive capacity** or the ability of the population, facilities and resource to withstand or whether away a climate change event; and the **vulnerability index**, the amount or degree of exposure of these same elements to any of the climate change event.

Mainstreaming CDRA Framework into the CLUP

THE CDRA PROCESS

- STEP 1. Collection and organization of climate change and hazard information** - This process involves the identification of local climate change projections using Climate Change in the Philippines published by PAGASA in February 2011 as the basic source of the climate change information for local government units. The report contains the projections for 2020 and 2050 under the high, medium, and low emission scenarios. The outputs of this step include data on: Local Climate Change Projections; Inventory of natural hazards and their characteristics; Tabular compilation of historical disaster damage/loss data; and Summary barangay level hazard inventory matrix.
- Step 2. Scope the potential impacts of climate hazards and climate change on the LGU** - This involves the identification of the various climate stimuli, derived from climate trends, climate change projections and hazards that will likely affect the municipality and the generation of impact chains to identify the possible direct and indirect that may likely affect the various development sectors. The output include: summary of potential climate change impacts and potentially exposed units and impact chain diagrams.
- Step 3. Exposure Database Development** - The Exposure Database provides the baseline information pertaining to the elements at risk. It shall provide the location, vulnerability/sensitivity and adaptive capacity attributes of the exposed elements which are necessary information when conducting a climate change vulnerability assessment (CCVA) and disaster risk assessment (CDRA). The output include: exposure maps (population, urban use areas, natural resource-based production areas, critical points, lifeline/infrastructure) and attribute information on exposure, sensitivity/adaptive capacity of the various exposure units
- Step 4. Conduct of a Climate Change Vulnerability Assessment (CCVA)** -The Climate Change Vulnerability Assessment (CCVA) is a tool which assesses the vulnerabilities of the locality to the various climate related stimuli. The tool is qualitative in approach and hopes to determine the level of vulnerability of identified areas or sectors of interest. Vulnerability shall be based on the extent of exposure, and an analysis of the sensitivities and adaptive capacities. The output for this step include: CCVA summary decision areas and issues matrix; CCVA vulnerability assessment map.
- Step 5. Conduct a Disaster Risk Assessment (DRA)** - Disaster Risk Assessment (DRA) is a methodology to determine the nature and extent of risk by analyzing potential hazards and evaluating existing conditions of vulnerability that together could potentially harm exposed people, property, services, livelihood and the environment on which they depend. The outputs of this step include: DRA summary decision areas and issues matrix and risk maps.
- Step 6. Summarize Findings** – This process take place after identification of priority areas. Spatial development issues and concerns are analysed and policy interventions are provided to address and reduce risks at tolerable levels. The outputs of this step includes: Identified major decision areas and list of risk management and adaptation/mitigation measures.

Climate and Hazard Information

A. Climate Change Information

Davao City falls under the Type IV climate of the Coronas Climate Classification System of the Philippine Atmospheric, Geophysical and Astronomical Sciences Administration (PAGASA). This climate type connotes that the rainfall is almost evenly distributed throughout the year.

For this CCVA, the provincial data of Davao del Sur is utilized with climate trends that have baseline period from 1971 to 2000 and projected changes for the years 2036 to 2065 as indicated in the Climate Change in the Philippines publication of PAGASA (Table CD – 1 and Table CD – 2, see next page). A representative concentration pathway (RCP) scenario of 8.5, a simulation of a worst case scenario, is integrated in the climate trends to determine the climate outcome whenever there are high levels of greenhouse gas emissions. The simulation of worst case scenario provides an image on what are the mitigating measures that should be pursued and established to prevent high levels of greenhouse gas emissions.

The projected temperature data of Davao del Sur. By 2036 to 2065, Davao del Sur's temperature is projected to slightly increase to 30°C from 27.8°C particularly in the months of March, April, and May. On the other hand, Table CD – 2 shows the projected rainfall data of Davao del Sur, which is projected to increase to 584.4 millimeters (mm) by 2036 to 2065 from 494.1 mm in baseline period of 1971 to 2000 in the months of June, July, and August when *Habagat* or southwest monsoon prevails. The southwest monsoon usually brings heavy rainfall, which usually occurs in the months of June to October.

Table CD – 1. Seasonal Temperature Increases in 2036-2065 Under High-Range Emission Scenario, Davao del Sur

Province	Observed (in °C) 1971 – 2000				Scenario	Range	Projected (in °C) 2036-2065

Climate Trends Using CLIRAM Tool

The Climate Information Risk Analysis Matrix (CLIRAM) provides the projected changes in climate variables, particularly for temperature and rainfall, in the mid-21st century, from 2036 to 2065 based on the 1971 to 2000 baseline period.

Under Table CD – 3 (see next page), the months of March, April, and May are projected to be the hottest season with temperature of 29°C to 30°C by 2036 to 2065 from 27.8°C in the same months of 1971 to 2000. The coldest season is expected to persist in the months of December to February with temperature of 28°C to 29.1°C from 26.9°C in the same months of 1971 to 2000.

Making projections under this matrix enables the city government to anticipate projected impacts, such as the emergence of heat-related illnesses and skin diseases during the hot season. The possibilities of water and power supply shortages, decline in crop production and rat infestation should also be factored in. Thus, it is an important information or more educational campaigns on health hazards, greening initiatives and activities, plant disaster-resilient crops and the promotion on the use of renewable energy.

Table CD – 4-A and 4-B (see pages 6 and 7) provides information on the projected seasonal rainfall in Davao del Sur for the mid-21st century. The highest possible future rainfall change will ensue during the southwest monsoon months, particularly from June to August, with an increase of 18.3% from 494.1 mm in the same months of 1971 to 2000.

The projected rainfall increase will lead to flood incidents especially in areas near waterways and sea level rise along coastal areas. This will further result to damage to properties, decrease in crop production pest and disease infestation, clogged canals, transport disruption, class suspension, loss of lives due to drowning, and decrease in economic activities. To avert adverse impact on people and properties, the local government shall ensure: 1) conduct of pre-emptive evacuation; 2) provide crop insurance for farmers; 3) plant climate-resilient varieties of crops; and 4) establish hazard resilient facilities. Residents in exposed communities shall be also required to wear protective gears as prevention to leptospirosis. Likewise, the City Health Office, shall ensure adequate supply of prophylaxis.

Table CD – 3. Accomplished CLIRAM of the Projected Seasonal Mean Temperature in Davao del Sur for the Mid-21st Century (2036-2065);

Season	Scenario	Range	Projected Change		Information About Patterns of Change	Potential Impacts	Adaptation Options

Hazard Maps

Davao City is susceptible to five different hazards such as flood, landslide, storm surge, liquefaction, and earthquake. Of the hazards, 75% or three of every four barangays, in Davao City are vulnerable to flood especially in areas along the Davao Gulf, Davao River, and other waterways. The areas are plotted in the hazard maps. Below are the details of the hazard maps:

Flood Map

A total of 142 barangays of the city are highly susceptible to flood (Flood Susceptibility Map, see page 9). These include the commonly flooded areas such as Matina Pangi, Matina Aplaya and Tigatto.

Landslide Map

A total of 99, or 54.39%, of the city's barangays are highly susceptible to landslides (Landslide see page 10). They include Baganihan, Mandug, Matina Crossing, Matina Pangi and Megkawayan.

Storm Surge Map

Of the 182 barangays, 41 or 22.52% of the barangays may be submerged by up to five-meter storm surge notably those close to the coast (Storm Surge Map, see page 11). The extent of the potential storm surge varies per area. A certain barangay may experience a storm surge with a height of two (2) meters up to five (5) meters.

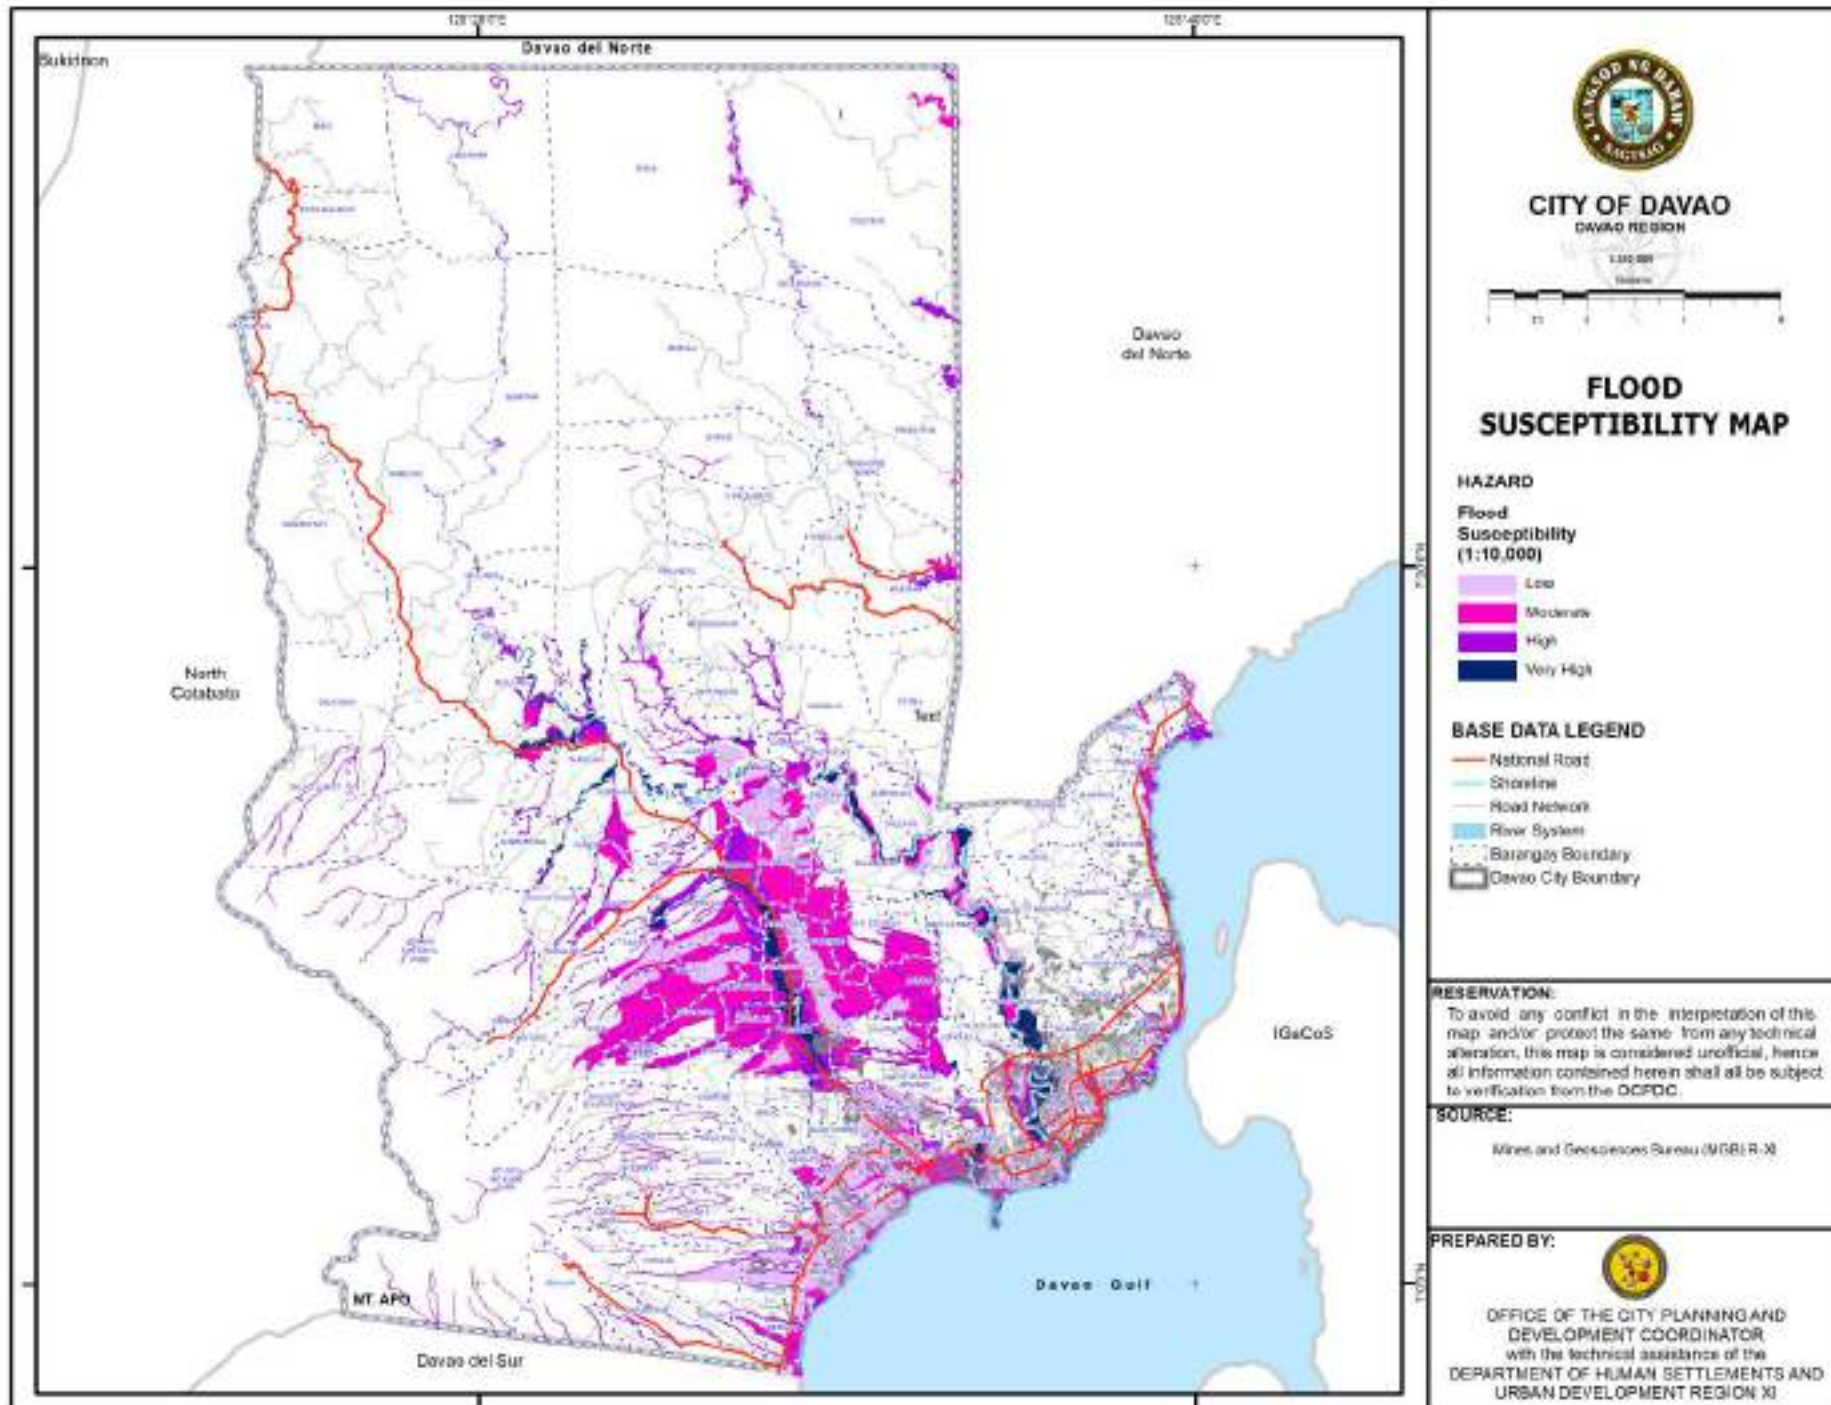

Active Fault Line Map

Fifty-five (55) barangays are traversed by the Colosas fault line, Dacudao fault line, Lacson fault line, New Carmen fault line, Pangyan-Biao Escuela fault line and Tamugan fault line. (Active Fault Line Map, see page 12).

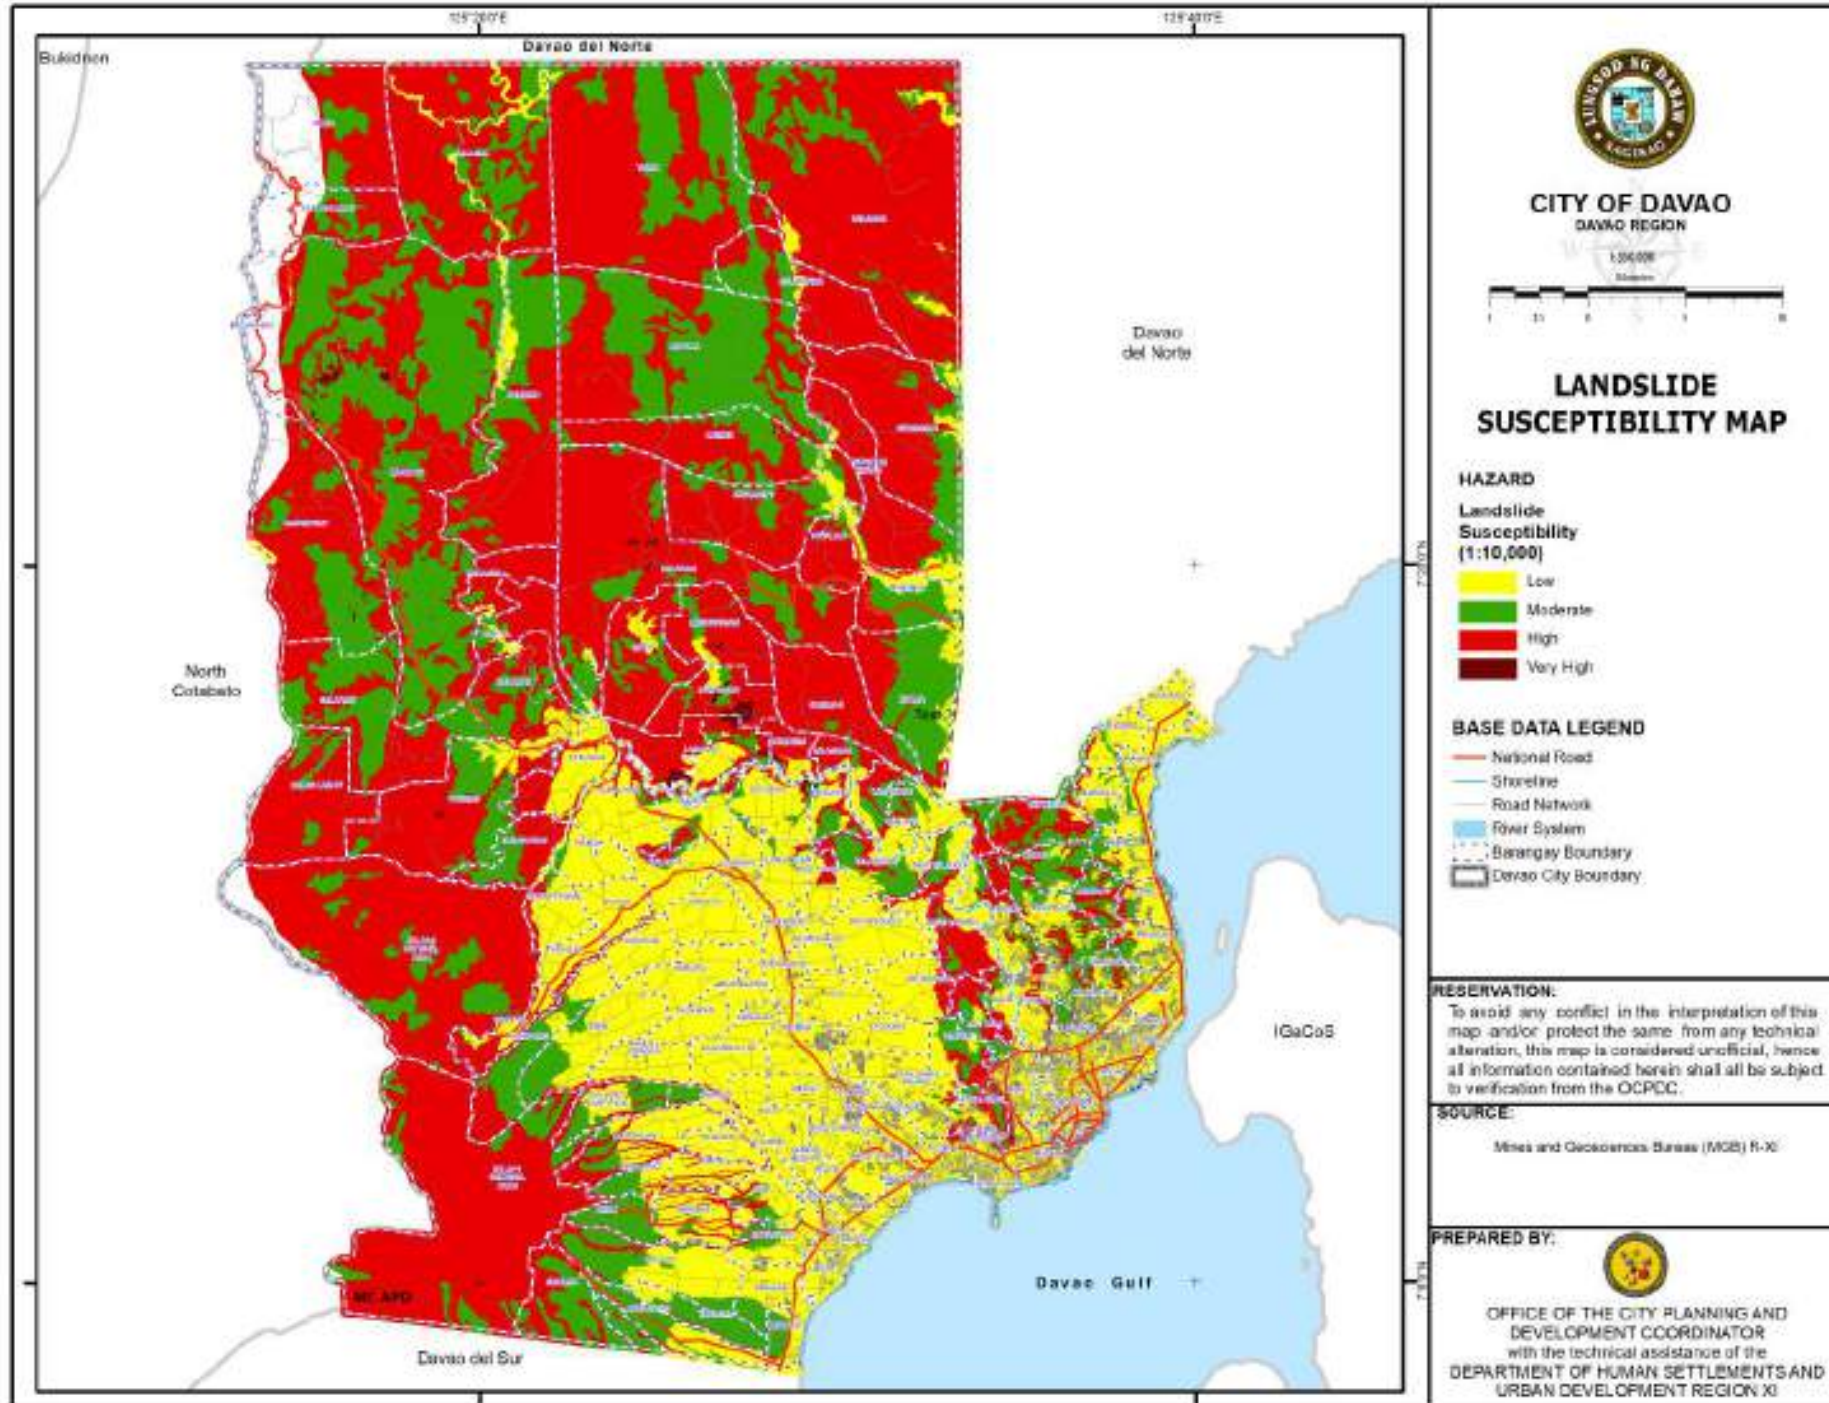

Liquefaction Map

Forty-two percent (42.30%), or 77 barangays, of the city are highly susceptible to liquefaction. These areas are situated near the waterways or those that were originally part of a water body. Among these barangays are Ma-a, Dumoy, Bago Aplaya, Lasang and Panacan (Liquefaction Susceptibility Map, see page 13).

Inventory of Hazards

Davao City is susceptible to flood, landslide, storm surge, and liquefaction. The city has also two (2) active fault systems, namely: Central Davao Fault System and Colosas Fault System.

Davao's susceptibility to these hazards is attributed to its geographical location, topography and soil type. Flood susceptibility is linked to the existence of landforms of topographic lows such as active river channels and areas along rivers which become natural catch basin of rainfall and makes the areas prone to flashfloods. Some areas of the city have steep to very steep slopes and underlain by weak materials making it susceptible to landslides. Escarpments and tension cracks from recent landslides and human-initiated utilization of slopes are also identified as aggravating factor for landslides. As portions of the city are facing the Davao Gulf, storm surge may also occur and can be brought by severe and unpredictable weather conditions such as typhoons. Meanwhile, there are also portions of the city which have loose to moderately saturated granular soils such as sand, that are susceptible to liquefaction. Presence of active fault systems in the city and presence of nearby fault lines make the city susceptible to damage brought by earthquakes.

Flooding incidents is a recurring problem in the city. The same hazard plagues 78% of the barangays in the city, with notable exception to barangays in mountainous areas namely Baganihan, Buda, Datu Salumay, and Magsaysay. At least 123 barangays and 100 barangays have low and moderate susceptibility to floods, respectively. Those with high susceptibility to floods are those areas that experience flood heights of more than one (1) meter, which takes place in over three (3) days. Barangays with moderate susceptibility to floods sustain flood heights of only 0.5 to one (1) meter for one (1) to three (3) days. Floods are experienced in less than a day with flood depth of less than 0.5 meter in barangays that have low susceptibility to floods.

Barangays near riverbanks, creeks, and other waterways, areas near them are also in danger of liquefaction. A total of 45 barangays, 47 barangays, and 77 barangays have low, moderate, and high susceptibility to liquefaction, respectively. Liquefaction occurs in loose to moderately saturated granular soils, where the space between the individual particles is completely filled with water.

Another hazard which adversely affect the public is landslide. As shown in Table CD – 5 (see next page), 178 barangays, 89 barangays, and 99 barangays have low, moderate, and high susceptibility to landslides, respectively. On the other hand, the Mines and Geosciences Bureau (MGB) – XI cites the barangays with low susceptibility to landslides are those located in gently sloping areas. Those with moderate susceptibility to landslides, on the other hand, are situated in areas with moderately steep slopes. The barangays with high susceptibility to landslides are positioned in areas with very steep slopes, or sloping areas with weak or weakened soil foundation.

Areas which are susceptible to storm surge are the barangays that face the Davao Gulf. A total of 45 barangays are susceptible to storm surge with a height of four (4) to five (5) meters. These areas have a potential to experience severe damage to coastal communities, which may occur in 24 hours. A storm surge with a height of two (2) to three (3) meters may also happen in 55 barangays. These barangays may experience a very high risk storm surge within 36 hours.

The city is also vulnerable to land movements with the presence of active fault systems which traverse through different areas. The Central Davao Fault System includes Dacudao Fault, Lacson Fault, New Carmen Fault, Pangyan-Biao Escuela Fault and Tamugan Fault, which run through 26 barangays, with many of these areas traversed multiple times by two or more fault lines. According to the Philippine Institute of Volcanology and Seismology (PHIVOLCS), these different fault line systems can trigger a strong magnitude earthquake. The 25-kilometer Tamugan Fault, 33-kilometer Lacson Fault, 18-kilometer Dacudao Fault, 33-kilometer Pangyan-Biao Fault, and 12-kilometer New Carmen

Fault can produce 6.7 magnitude earthquake, 6.8 magnitude earthquake, 6.5 magnitude earthquake, 6.8 magnitude earthquake, and 6.3 magnitude earthquake, respectively. Another active fault line system is the Colosas Fault System in Colosas, Paquibato District.

Records of Previous Disasters

Floods and landslides are two (2) of the most common natural disasters in Davao City, which frequently recur in a year. The city's location with a lot of watersheds, gulf, mountains, and hills, makes it vulnerable to these.

Flood Incidents

Disaster records from 2000-2019 show that flooding incidents usually happen during the first quarter of the year, when the city experiences the coldest season brought by rainy weather. In February 2000, a total of 3,938 families in Talomo Proper, Matina Crossing, Matina Pangí, Catalunan Grande and Bago Aplaya were affected, while in January of 2002, at least 17,784 families were affected in the flooding of Poblacion, Talomo, Buhangin, Bunawan and Calinan.

In 2006, about 1,049 families were affected in the flooding of Talomo Proper. Of the four (4) major reported incidents, it was the flooding in March 2008 that recorded the highest number of families, which affected 297 families or 1,017 dependents. The flooding occurred in six (6) barangays such as Calinan Proper, Riverside, Wangan, Baguio Proper, Malagos, and Los Amigos, all of which are located in the Third District.

For 2010, there were 16 reported flooding incidents, one (1) happened during the first month of the year while 15 happened in the second half of the year. Of the 15 incidents, six (6) occurred during the month of September, five (5) happened on September 13 in Suawan, Magsaysay, Marilog Proper, Salaysay and Malamba and one (1) on September 21 in Mandug.

June 2011 registered the most number of flooding incidents that year with 18 from a total of 55, in the whole year of 2011. The flashflood incident on June 29, 2011 was the worst natural disaster to hit the city with 30 deaths. It also affected 3,307 families and damaged 765 houses in Ma-a, Matina Pangí, Matina Aplaya, Matina Crossing, and Talomo Proper. The flashflood occurred when Matina Pangí River overflowed due to heavy downpour. It took six (6) hours for the floodwaters to subside, which reached up to 10 feet or three (3) meters. The flood also destroyed the Balusong Bridge, Matina Pangí Bridge, and other bamboo and hanging bridges in Matina Crossing.

In August 2014, a total of eight (8) flooding incidents were recorded with 146 affected families in Barangays Matina Pangí, Matina Crossing, and Matina Aplaya and within downtown areas.

Only three (3) flooding incidents were recorded in 2015 and 2016. Barangays Talomo, Sto. Niño and Gumitan experienced flooding in 2015, while Barangays 10-A, Gumitan and Suawan suffered the same fate in 2016. Both years recorded the number of lowest flood incidents in the City from 2000-2019.

There were no recorded flood incidents during the first quarter of 2017; while the rest of the year recorded 30 incidents, affecting 10 barangays with a total number of 38 dependents.

The six (6) incidents in 2018 happened in barangays Riverside, Sto. Nino, Catalunan Pequeno, Tugbok Proper, Talomo Proper and Catalunan Grande. For 2019, only two (2) were reported involving Barangays Bato and Daliao in Toril District such flooding incidents were recorded in January.

Landslide Incidents

Landslides frequently hit the northern mountain areas of the city.

The year 2002 recorded the most number of families affected by landslide with 2,697 or 10,481 dependents in Barangays Marilog, Paquibato, Baguio and Calinan. There were zero reported landslide incidents in 2003, 2004 and 2005.

In 2006, only three (3) incidents were reported in Carmen, San Isidro and Marilog Proper, which affected 114 families. The year 2007 recorded the lowest occurrence, with only one (1) incident, but resulted to the death of two (2) persons in Brgy. Ma-a, Talomo District.

No incidents were recorded in 2009 and 2010, while 2011 recorded five (5) landslide incidents, which affected 1,331 families. In 2012, there were two incidents of landslide involving Barangays Magsaysay, Marilog and Fatima; while the year 2013 recorded two (2) cases in Buhangin Hills and Sto Niño. In 2014, there were nine (9) incidents were reported in Guadalupe Village, Pansoy Compound, Matina Crossing, Baganihan, Suawan, Salaysay, and Lumiad. In Tambobong, there were three (3) reported landslides, which happened in February, May and November 2014.

Landslide incidents occurred in June, September, and October 2015 and in April, June, and October 2016. In 2017, a total of 16 landslide incidents happened in April to July and August to December that affected 83 families, including areas in Diversion Road where huge boulders fell down from the hilly parts of Ma-a, Langub, Matina Pangi, and Matina Crossing. The occurrence of landslides in the said areas prompted the temporary closure of Diversion Road from October 5 to November 30, 2017.

Only two (2) landslides happened in 2018 particularly in Barangays Langub and Cabantian.

In 2019, there is one landslide incident recorded in Barangay Malabog.

Table CD – 6A. Records of Previous Disasters, Davao City, 2000-2019

Hazard Events and Description	Affected Barangays	No. of Affected			No. of Casualties			No. of Casualties

Hazard Susceptibility Inventory Matrix

Two (2) out of 182 barangays in the city, which are Talomo Proper in Talomo District and Binugao in Toril District, are susceptible to all the identified five hazards, namely: flood, landslide, fault line, liquefaction, and storm surge. Over one-fourth or 27% are susceptible to both floods and landslides. At least 17% of the barangays are susceptible to flood, landslide and fault line while another 30 barangays are susceptible to both storm surge and liquefaction. Only barangays 18-B, Baguio Proper, Crossing Bayabas, and Toril Proper are susceptible to one hazard. Barangay 18-B is solely susceptible to storm surge while Baguio Proper, Crossing Bayabas, and Toril Proper are susceptible to fault line, flood, and liquefaction, respectively.

Projected Changes in Climate Variables and Potential Affected Exposure Unit/s

Increases in rainfall and temperature may potentially affect different exposure units such as population, natural resource-based production areas, critical point facilities, urban use areas, and lifeline utilities.

All the five (5) exposure units may be affected when there is heavy downpour particularly in the months of June, July, and August when Southwest Monsoon winds are expected to prevail. These months are projected to have rainfall amount of 584.4 mm, which may result to flooding especially in areas near waterways.

Increases in rainfall may potentially damage the properties (residential units, commercial and industrial establishments, schools, barangay halls, and other critical point facilities, and lifeline utilities like roads, bridges, power and water distribution lines). This may also affect crops and other natural resources.

The rainy season affects the entire populace, increasing also their vulnerability to health hazards like malaria and dengue, both mosquito-borne diseases associated with this season. Another life threatening health hazard during rainy season is leptospirosis, a bacterial infection from rodents that affects humans and animals. According to the World Health Organization, person contract the disease through waters contaminated by the urine of infected rodents. The WHO further said that the number of cases may even reach epidemic proportions during the rainy season due to frequent flooding.

Heavy rains may also cause polio outbreak and cause contamination of water through sewage systems. Davao River recently tested positive of polio virus, and thus, may spread in the entire city. Households that lack sanitary toilets are at risk of contracting the disease. As of 2010, the Philippine Statistics Authority (PSA) reports that there are still 35,085 households or 10.49% of the total number of households that lacked water-sealed toilets.

The five (5) exposure units may also be affected when there would be dry season particularly in the months of September, October, and November. These months are projected to have the lowest rainfall amount with 378.5 mm.

Increases in temperature may as well affect the population, natural resource-based production areas, critical point facilities, urban use areas, and lifeline utilities particularly in the months of March, April, and May (Table CD – 9, see page 51). These months are projected to be the hottest season with temperature of 29°C to 30°C by 2036 to 2065.

The health of the population will be at risk as they may experience skin diseases, heat illnesses, and respiratory infections. Increases in temperature may also lead to cracks and damages to properties (residential units, commercial and industrial establishments, schools, barangay halls, and other critical point facilities, and lifeline utilities like roads, bridges, power and water distribution lines). The natural-based production areas, including agricultural areas, may also suffer the impact of dry season.

Table CD – 8A. Summary of Projected Changes in Rainfall and Potential Affected Exposure Unit/s, Davao City

Season	Scenario	Range *	Projected Change		Projected Seasonal Rainfall Amount (mm)	Information About Patterns of Change	Potential Impacts	Adaptation Option	Population	Natural Resources Based Production	Urban Areas	Critical Point Facilities	Lifeline Utilities
			%	Rainfall amount (mm)									
		Lower Bound	-8.4	-24.2	263.9	slight decrease in rainfall amount	-	-	No	No	No	No	No
		Median	-0.9	-2.5	285.6	minimal to no change in rainfall amount	-	-	No	No	No	No	No
		Upper Bound	16	46.1	334.2	The highest possible future rainfall change during the Northeast Monsoon shows an increase of 16%.	<p>Occurrence of floods in areas near waterways, landslide and possible sea level rise in coastal barangays/communities, which will result to:</p> <ul style="list-style-type: none"> > damage to properties (e.g., houses, bridges, roads, other establishments) > decrease in crop production > pest and disease infestation > clogged canals > transport disruption > class suspension > loss of lives due to drowning > decrease in economic activities 	<ul style="list-style-type: none"> > Conduct pre-emptive evacuation > Farmers should be insured with risk financing programs/ crop insurance > Empower farmers by enrolling them in Farmer-Field School (e.g., early harvests) > Introduce climate-resilient varieties of crops > Build hazard-resistant facilities. > Require communities to wear protective gears as prevention to leptospirosis > Ensure supply of prophylaxis 	Yes	Yes	Yes	Yes	Yes

Impact Chain Diagrams

The diagrams in the next pages are the combined outputs of the sectors during the workshops for this Climate and Disaster Risk Assessment in May 2019. These are the impact chain diagrams, which are important for the city government to easily identify the key development areas/sectors where climate change and disasters will likely impact; and to guide the detailed study of establishing the level of risks and vulnerabilities of the city.

Under Diagram CD – 1 (see next page), increases in rainfall may attribute to sea/river water level rise, floods, and landslides, which eventually will affect and damage the exposed critical facilities, settlements, production areas, lifeline utilities, and establishments in urban use areas. One exposure unit that is highly vulnerable is population, especially the dependent population (children and senior citizens), which may obtain severe diseases/illnesses or suffer from drowning that may result to the loss of his/her life. Communities especially those near the waterways may also be displaced due to damage of settlement. Another possible consequence is incurring food shortage if there would be a decline/loss in crops, livestock, poultry, and fish production. There might also be an interruption of services and disruption of people's mobility and communication access once the critical point facilities and lifeline utilities would be damaged, thereby resulting to the delay on the delivery of goods and services.

Incidents such as sea/river water level rise, floods, and landslides may as well affect parks/recreation, tourism, commercial, and industrial establishments. Owners may close their businesses, which may eventually result to the displacement of workers, thereby having income and employment loss.

Another impact chain is shown in Diagram CD – 1, which outlines consequences as a result of the temperature increase. As bared in the diagram, increases in temperature may lead to sea temperature rise and drought. The sea temperature may as well attribute to coastal erosion and red tide while drought is expected to cause heat wave and reduction of soil moisture. Among the worst consequences brought by these possible incidences include possible displacement of communities, high incidence of diseases, food shortage, rat infestation, reduction in vegetative cover, and economic losses.

Diagram CD – 1. Climate Change Impact Chain Multiple Sectors, Increase in Rainfall, Davao City

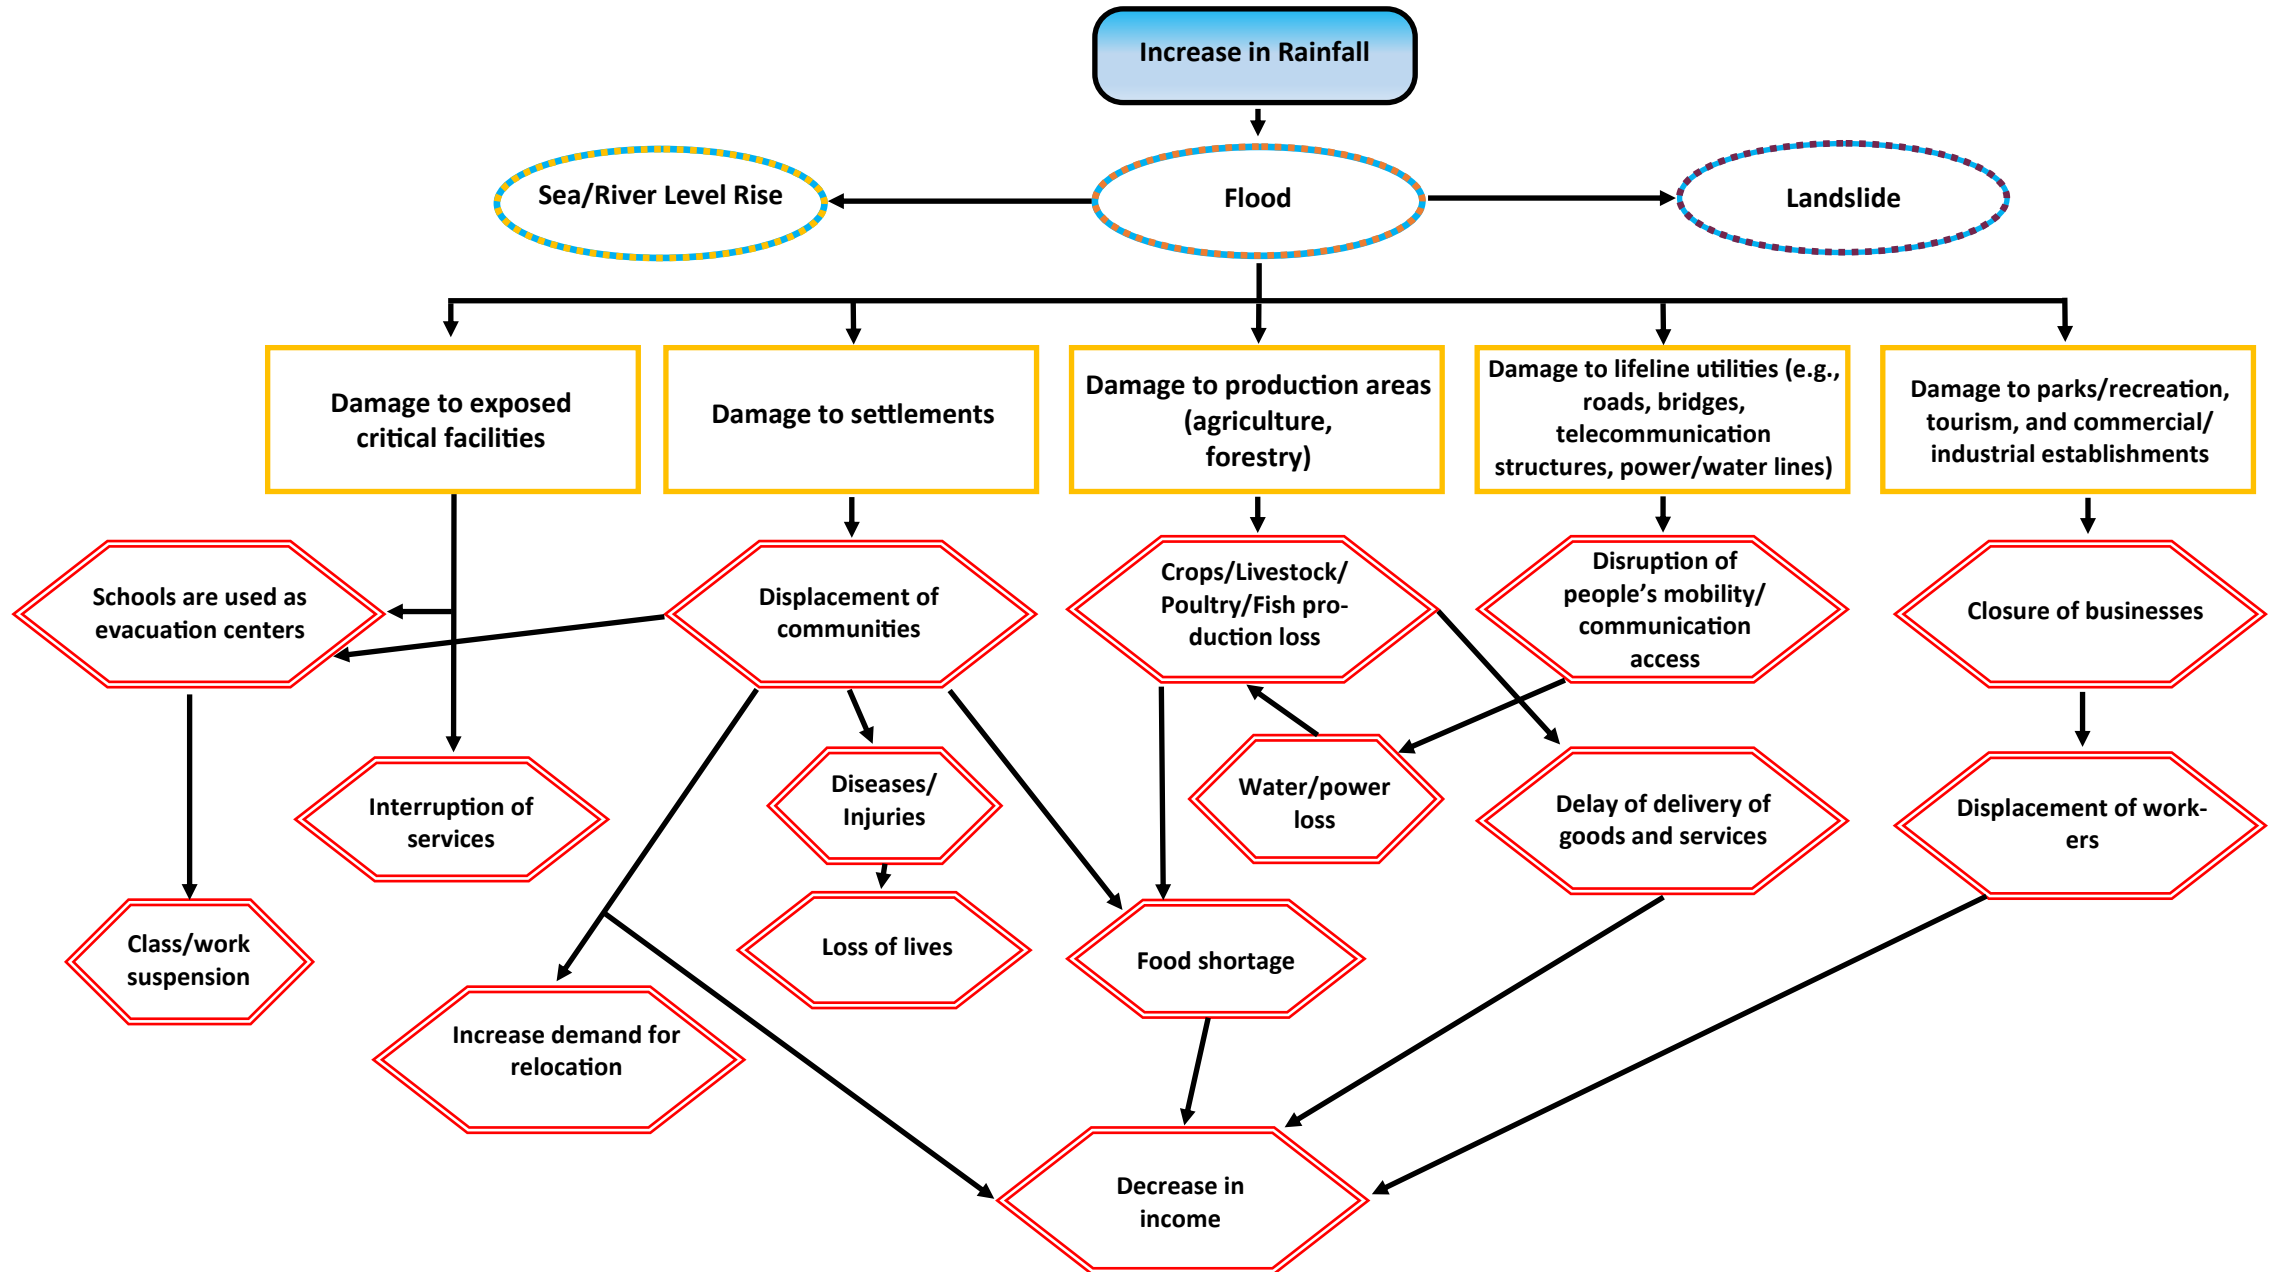

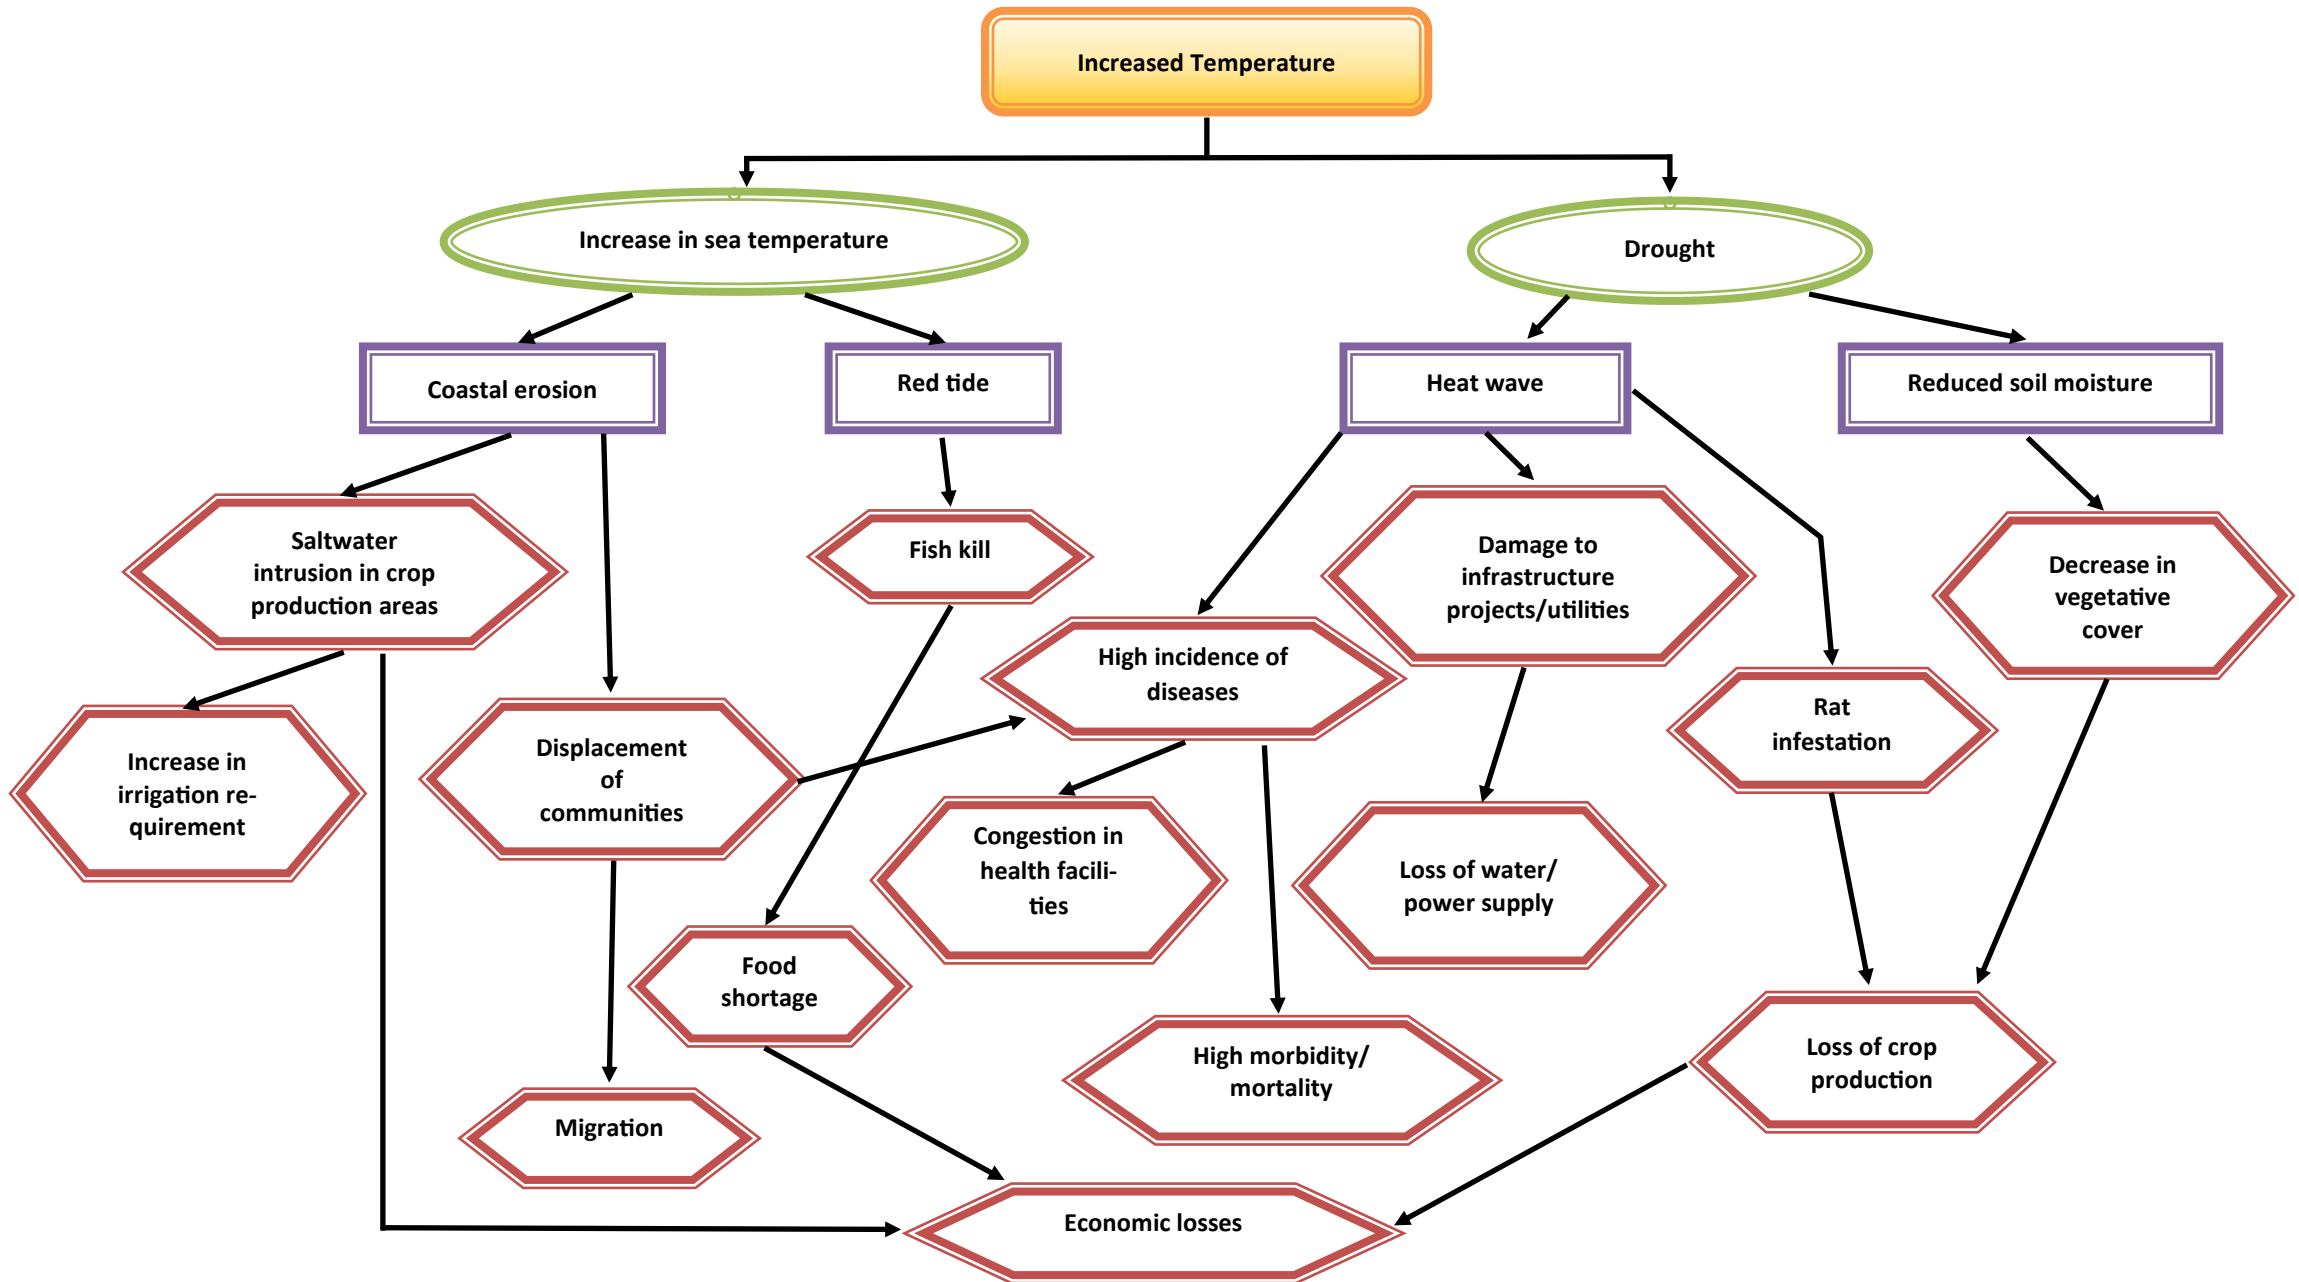

Diagram CD – 2. Climate Change Impact Chain Multiple Sectors, Temperature Rise, Davao City

Summary of Climate Change Impacts

The table below shows the summary of climate change impacts, which may greatly affect the exposure units such as population, natural resource based production areas, critical point facilities, urban use areas, and infrastructure and utilities whenever there are increases in rainfall and temperature. Increase in rainfall will potentially affect 142 barangays, which are highly susceptible to floods, while the rise in temperature may affect the entire city.

Table CD – 10. Summary of Climate Change Impacts, Davao City

Climate Variable	General Changes Expected in Climate Variables	Information About Patterns of Change	Population	Natural Resource Based Production Areas	Critical Point Facilities	Urban Use Areas	Infrastructure and Utilities	Potential Impact Areas
Rainfall	The highest rainfall amount is expected to range between 459.2mm – 584.4mm in the months of June, July, and August	The highest possible future rainfall change during Southwest Monsoon and Northeast Monsoon shows an increase of 18.3%. This is the highest percent change among the four seasons	Moderate to high	Moderate to high	Moderate to high	Moderate to high	Moderate to high	1-A, 2-A, 5-A, 8-A, 19-B, 21-C, 22-C, 23-C, 27-C, 31-D, 37-D, 39-D, 40-D, Rafael Castillo, Centro, Gov. Vicente Duterte, Leon Garcia Sr., Lapu – Lapu, San Antonio, Ubalde, Baguio, Cadalian, Carmen, Gumalang, Malagos, Tambobong, Tawan-Tawan, Wines, Acacia, Buhangin, Cabantian, Callawa, Communal, Indangan, Mandug, Pampanga, Sasa, Tigatto, Waan, A. Angliongto, V. Niño, Tacunan, Tagakpan, Tugbok, and Ula
Temperature	The seasonal mean temperature will range to 29.2°C - 30.1°C	The months March, April, and May are projected to be the hottest Season	Moderate to high	Moderate to high	Moderate to high	Moderate to high	Moderate to high	Entire Davao City

Exposure Database Development

The Exposure Database provides the baseline information pertaining to the elements at risk. It shall provide the location, vulnerability/sensitivity and adaptive capacity attributes of the exposed elements which are necessary information when conducting a climate change vulnerability assessment (CCVA) and disaster risk assessment (CDRA).

For the purpose of this study, Exposure maps of five key elements were produced. These key elements are Population, Urban Use Areas, Natural Resource-based Production Areas, Critical Points, lifeline/infrastructure).

- Population: includes population of individuals in barangays.
- Critical Point Facilities: Social services facilities extended to the city's residents in the form of schools, hospitals, barangay halls, barangay health stations, police outposts and sub-stations, fire stations, among others.
- Lifeline Utilities: Roads, bridges, power, water, and communication facilities
- Natural Resource-Based Production areas: Areas for agriculture, forestry, and fishery production areas.

In this study, the Exposure Database which includes information off sensitivity/adaptive capacity of the various exposure units was accomplished. The exposure, sensitivity and adaptive capacity varies per exposed key element.

Climate Change Vulnerability Assessment

CCVA determines the nature and degree to which a system is exposed to climate variations, the degree to which it is affected adversely or beneficially, and the ability of the system to adjust to climate change.

Overall results of the CCVA show the levels of vulnerability of Davao City to five different hazards according to the topography of the metropolis. One identified hazard is landslide, especially in areas where there are mountain ranges. Floods and liquefaction may as well arise particularly in villages near Davao Gulf, Davao River, and other water bodies. The presence of Colosas fault line, Dacudao fault line, Lacson fault line, New Carmen fault line, Pangyan-Biao Escuela fault line and Tamugan fault line in 55 barangays may trigger tremors in the city.

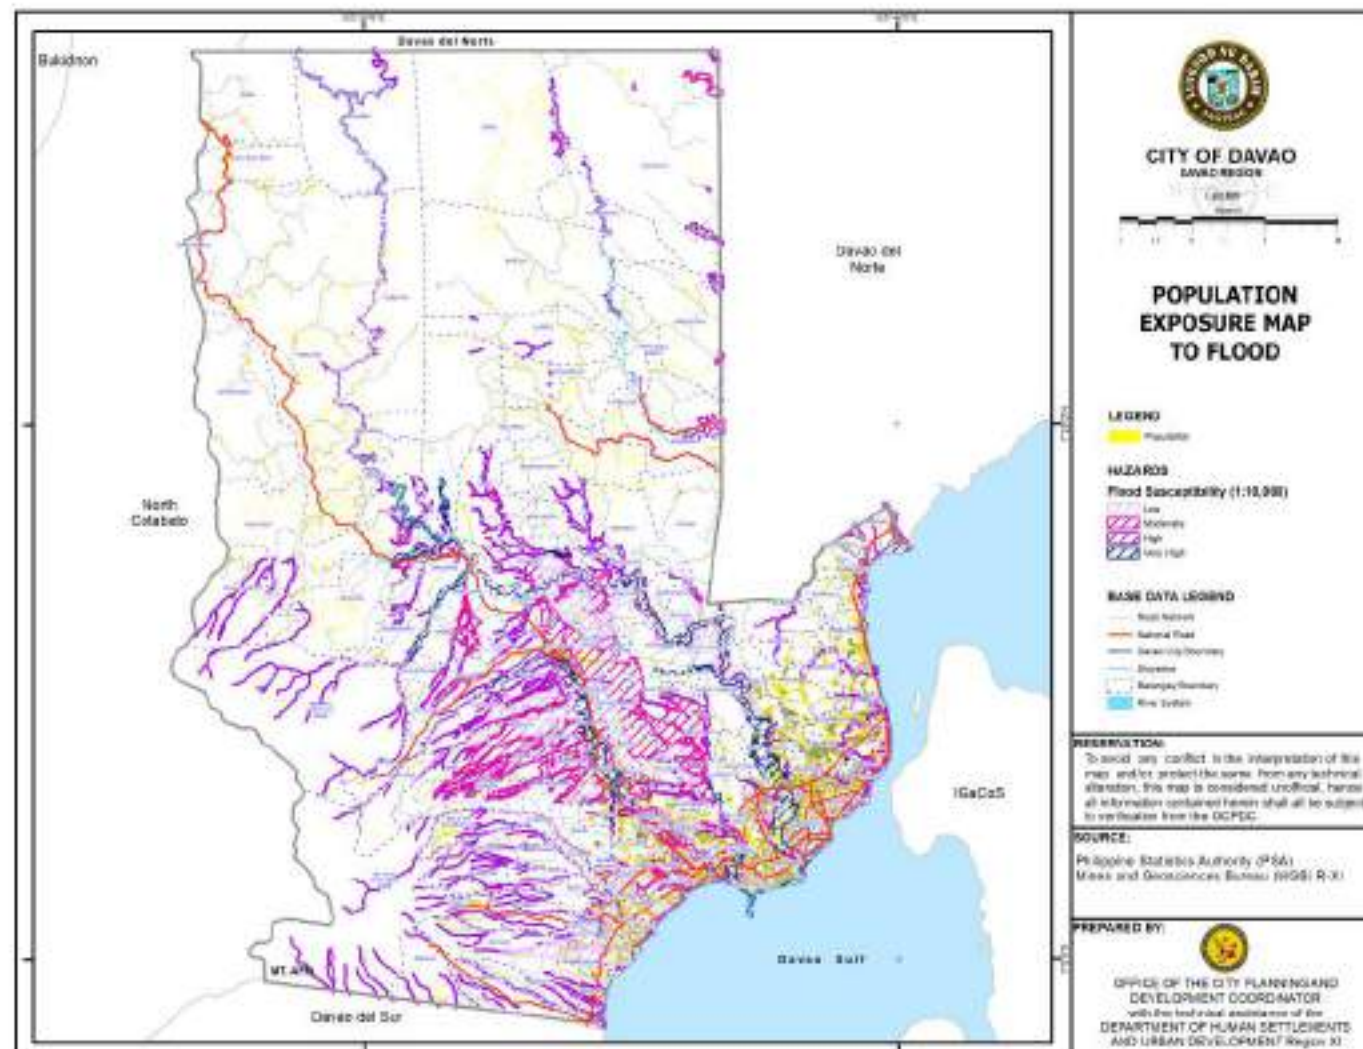

SUMMARY OF FINDINGS OF EXPOSURE DATABASE, CCVA AND DRA

Population Exposure Database

Flood

- Flood can potentially affect 1,625,154 persons, who occupy parcels of residential areas that total to 8,600.07 hectares, in 178 barangays in Davao City.
- Barangay Bucana, which is the most populous barangay with 83,964 persons, has the largest presence of informal settlers that total to 7,405.
- Talomo Proper also has the highest number of households living in dwelling units with walls made from light to salvageable materials that total to 22,776.
- Of the total population in Davao City, 40.3% are dependent population or those who are either young (ages 0-14 years old) or old (65 years old and above). On the other hand, the percentage of households living below the poverty threshold is 12%*.
- In terms of adaptive capacity, there are approximately 60% of the families in Davao City which have access to post disaster financing and benefits from government agencies like Government Service Insurance System (GSIS) and Social Security System (SSS). A total of 892,578 members and 1,055,525 dependents of Philippine Health Insurance Corp. (PhilHealth) were also identified.
- Families may also have difficulty to relocate or retrofit given current capacities within short to medium plans. They are only willing to pursue relocation/retrofitting if provided with external assistance from the local and national governments.

Map 1. 6. Population Exposure Map to Flood, Davao City

Landslide

- This hazard can potentially affect 1,632,911 persons, who occupy parcels of residential areas that total to 8,655.14 hectares, in all barangays in Davao City.
- Barangay Bucana, which is the most populous barangay with 83,964 persons, has the largest presence of informal settlers that total to 7,405. Talomo Proper has also the highest number of households living in dwelling units with walls made from light to salvageable materials that total to 22,776.

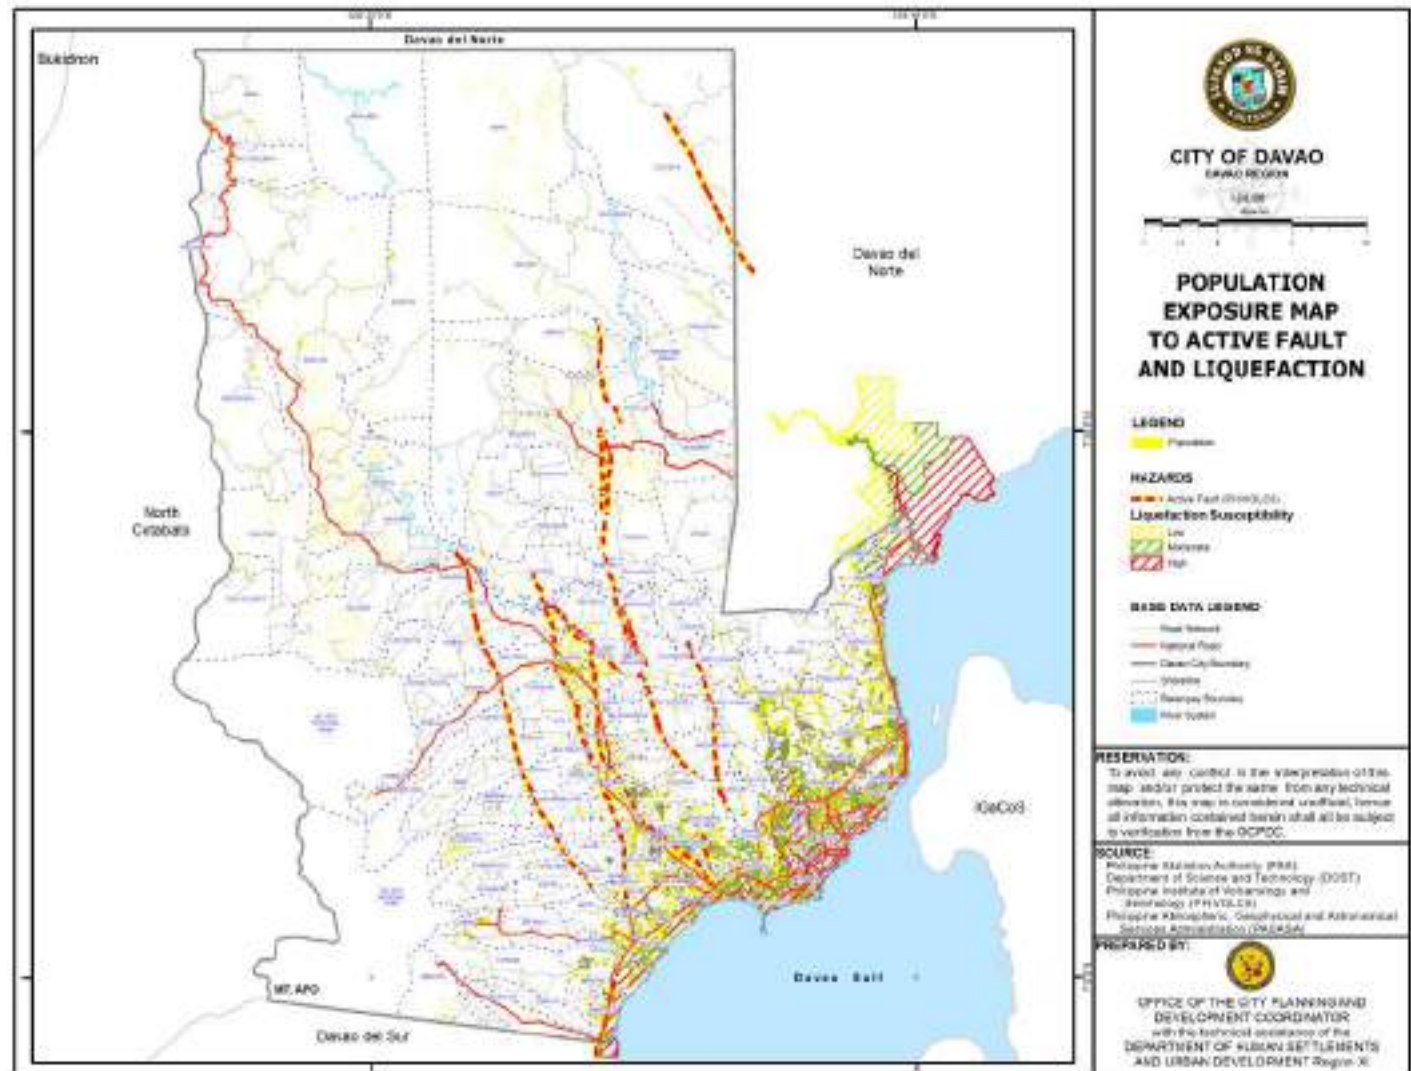

Fault Line

- The presence of fault line systems can potentially affect 429,238 persons, who occupy parcels of residential areas that total to 2,532 hectares, in 55 barangays in Davao City.
- Among the barangays with fault line systems, Talomo Proper has the largest number of informal settlers with 4,331 and the highest number of households living in dwelling units with walls made from light to salvageable materials that total to 22,776.

Liquefaction

- This hazard can potentially affect 1,250,363 persons, who occupy parcels of residential areas that total to 6,646.45 hectares, in 103 barangays in Davao City.
- Barangay Bucana, which is the most populous barangay with 83,964 persons, has the largest presence of informal settlers that total to 7,405.
- Talomo Proper has also the highest number of households living in dwelling units with walls made from light to salvageable materials that total to 22,776.

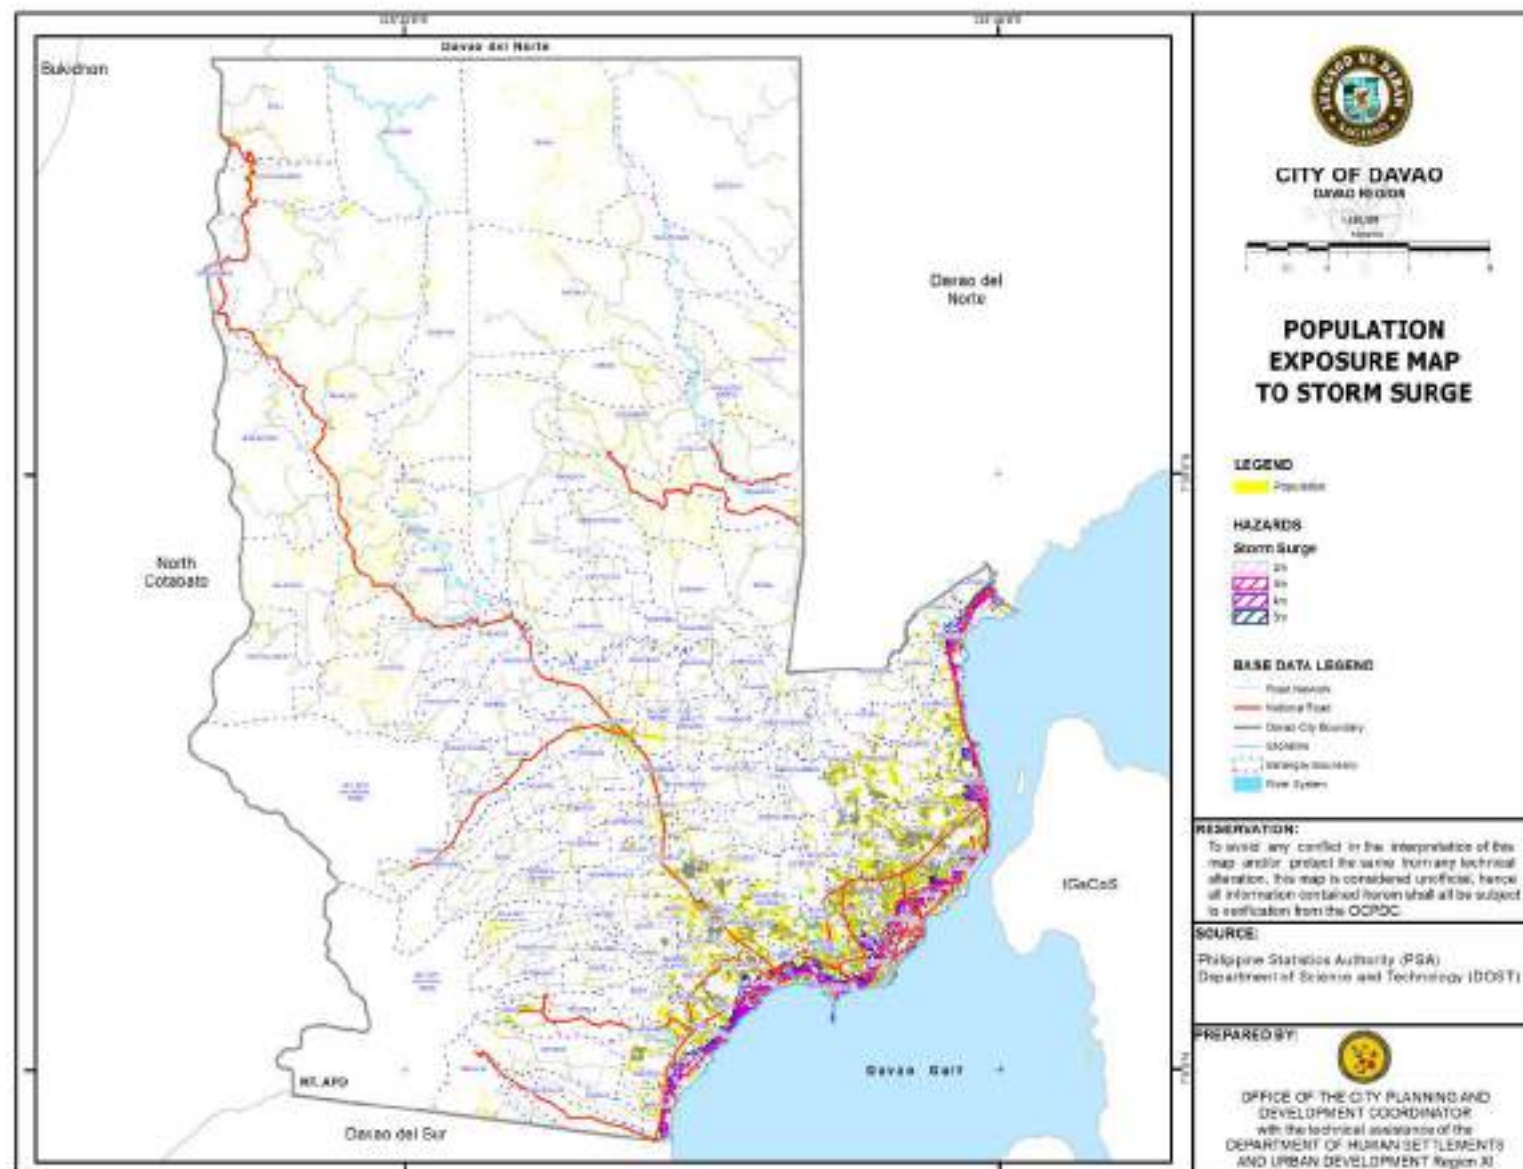

Map 1. 7. Population Exposure Map to Active Fault and Liquefaction, Davao City

Storm Surge

- This hazard can potentially affect 892,427 persons, who occupy parcels of residential areas that total to 4,254.91 hectares, in 74 barangays in Davao City.
- Barangay Bucana, which is the most populous barangay with 83,964 persons, has the largest presence of informal settlers that total to 7,405.
- Talomo Proper has also the highest number of households living in dwelling units with walls made from light to salvageable materials that total to 22,776. At least 40.3% are considered as dependent population or those who are either young or old.

Map 1. 8. Population Exposure Map to Storm Surge , Davao City

Adaptive Capacity for Population

Flood

- The areas with the lowest adaptive capacity scores in curbing the effect of floods include Barangays 1-A, 2-A, 5-A, 8-A, 15-B, and 19-B in Poblacion District, A. Angliongto, Buhangin Proper, Cabantian, Callawa, Communal, and Indangan in Buhangin District, Bunawan Proper, Panacan, and Ilang in Bunawan District, Bucana, Matina Aplaya, Matina Crossing, Matina Pangi, and Talomo Proper in Talomo District, and Los Amigos in Tugbok District.
- These areas have 151,919 of exposed population to floods.

Landslide

- The areas with the lowest adaptive capacity scores in addressing the effect of landslides are Barangays 19-B in Poblacion District, Carmen, Gumalang, Tambobong, and Tawan-Tawan in Baguio District, A. Angliongto, Acacia, Buhangin Proper, Cabantian, Callawa, Communal, Indangan, Mandug, Sasa, Tigatto, and Waan in Buhangin District, Bunawan Proper, Gatungan, Ilang, Mahayag, Mudiang, Panacan, San Isidro, and Tibungco in Bunawan District, Biao Joaquin, Calinan Proper, Dalagdag, Dominga, Inayangan, Lacson, Lamanan, Lampianao, Megkawayan, Pangyan, Saloy, Sirib, Talomo River, and Tamayong in Calinan District, Baganihan, Bantol, Buda, Dalag Lumot, Datu Salumay, Gumitan, Magsaysay, Malamba, Marilog Proper, Salaysay, Suawan, and Tamugan in Marilog District, Colosas, Fatima, Lumiad, Mabuhay, Malabog, Mapula, Pandaitan, Panalum, Paquibato Proper, Paradise Embac, Salapawan, Sumimao, and Tapak in Paquibato District, Catalunan Grande, Langub, Ma-a, Magtuod, Matina Crossing, Matina Pangi, and Talomo Proper in Talomo District, Alambre, Atan-Awe, Baracatan, Bato,

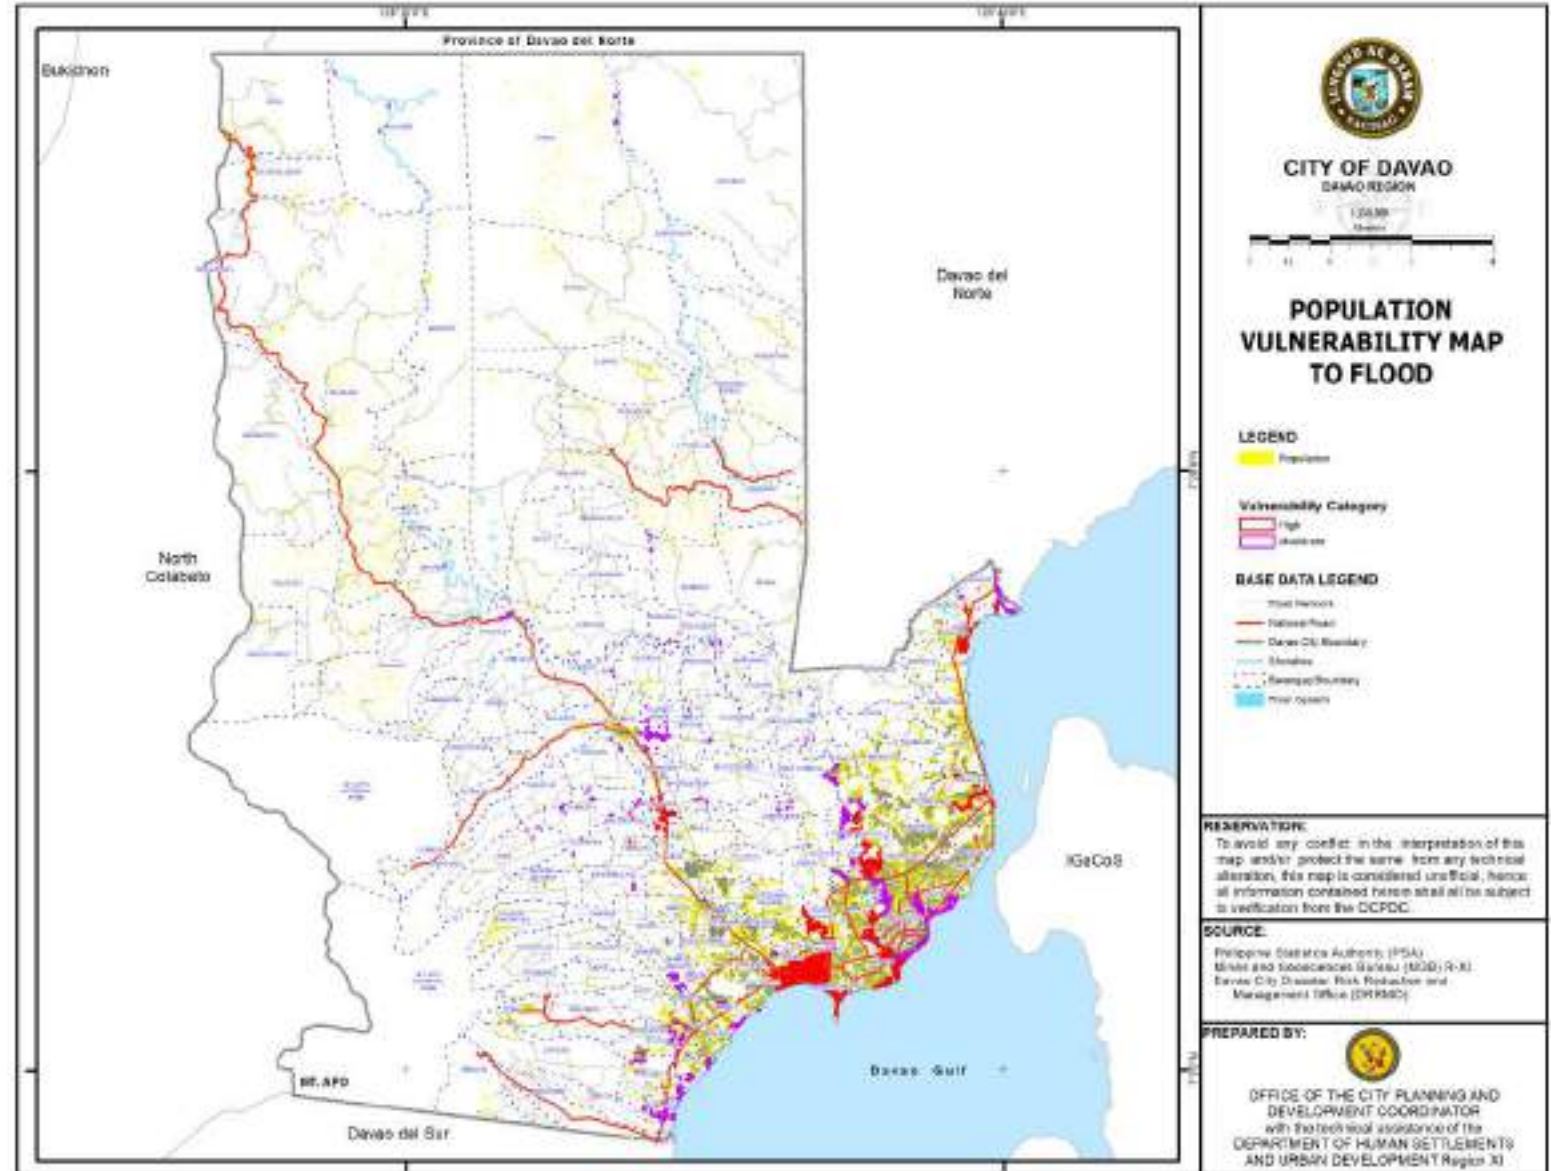

Liquefaction

- The areas with the lowest adaptive capacity scores in curbing the effect of liquefaction are Barangays 21-C, 22-C, 23-C, 31-D, and 37-D in Poblacion District, Centro, Gov. Vicente Duterte, and Lapu-Lapu in Agdao District, Lasang, Bunawan Proper, and Panacan in Bunawan District, Bago Aplaya, Bago Gallera, Bucana, Catalunan Grande, Dumoy, Matina Aplaya, and Talomo Proper in Talomo District, and Binugao, Lizada, Sirawan, and Toril in Toril District.
- These areas have 311,888 of exposed population to liquefaction.

Population Vulnerability Index

Flood– A total of 13 barangays are highly vulnerable to flooding. Results show that the residential areas in Barangays 1-A, 2-A, 5-A, and 8-A in Poblacion District, Tigatto in Buhangin District, Bunawan Proper and Panacan in Bunawan District, Bucana, Matina Aplaya, Matina Crossing, Matina Pangi, and Talomo Proper in Talomo District, and Los Amigos in Tugbok District are highly vulnerable to floods.

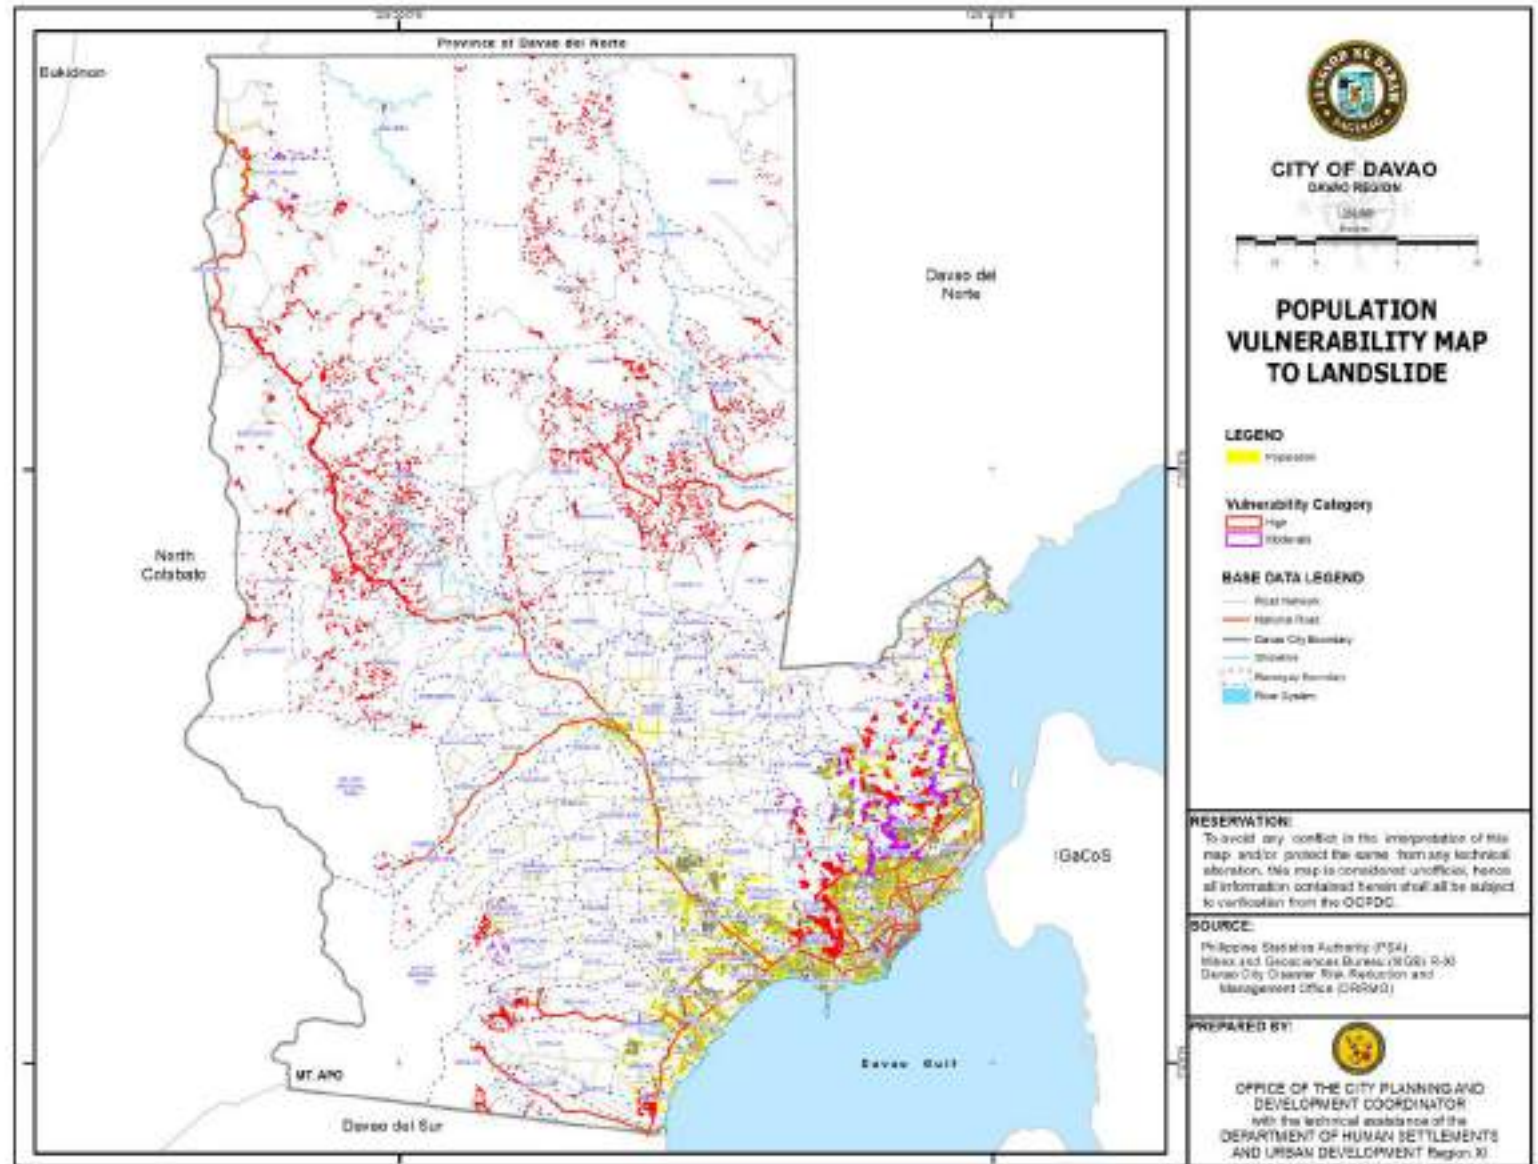

Map 1. 9. Population Vulnerability Map to Flood, Davao City

Population Vulnerability Index

Landslide— A total of 51 barangays vulnerable to landslide. Results show that the residential areas in Barangays Carmen and Tambobong in Baguio District, Acacia, Communal, and Indangan in Buhangin District, Gatungan and Mudiang in Bunawan District, Dalagdag, Inayangan, Lamanan, Lampianao, Megkawayan, Saloy, and Tama-yong in Calinan District, Bantol, Dalag Lumot, Gumitan, Magsaysay, Malamba, Marilog Proper, Salaysay, and Suawan in Marilog District, Colosas, Fatima, Lumiad, Ma-labog, Mapula, Pandaitan, Pañalum, Paquibato Proper, Paradise Embac, Salapawan, Sumimao, and Tapak in Paquibato District, Langub, Ma-a, Magtuod, Matina Crossing, and Matina Pangi in Talom District, Atan-Awe, Baracatan, Bayabas, Binugao, Camansi, Catigan, Daliaon Plantation, Eden, Sibulan, Tagurano, and Tibuloy in Toril District, and Matina Biao in Tugbok District are highly vulnerable to landslides

Map 1. 10. Population Vulnerability Map to Landslide, Davao City

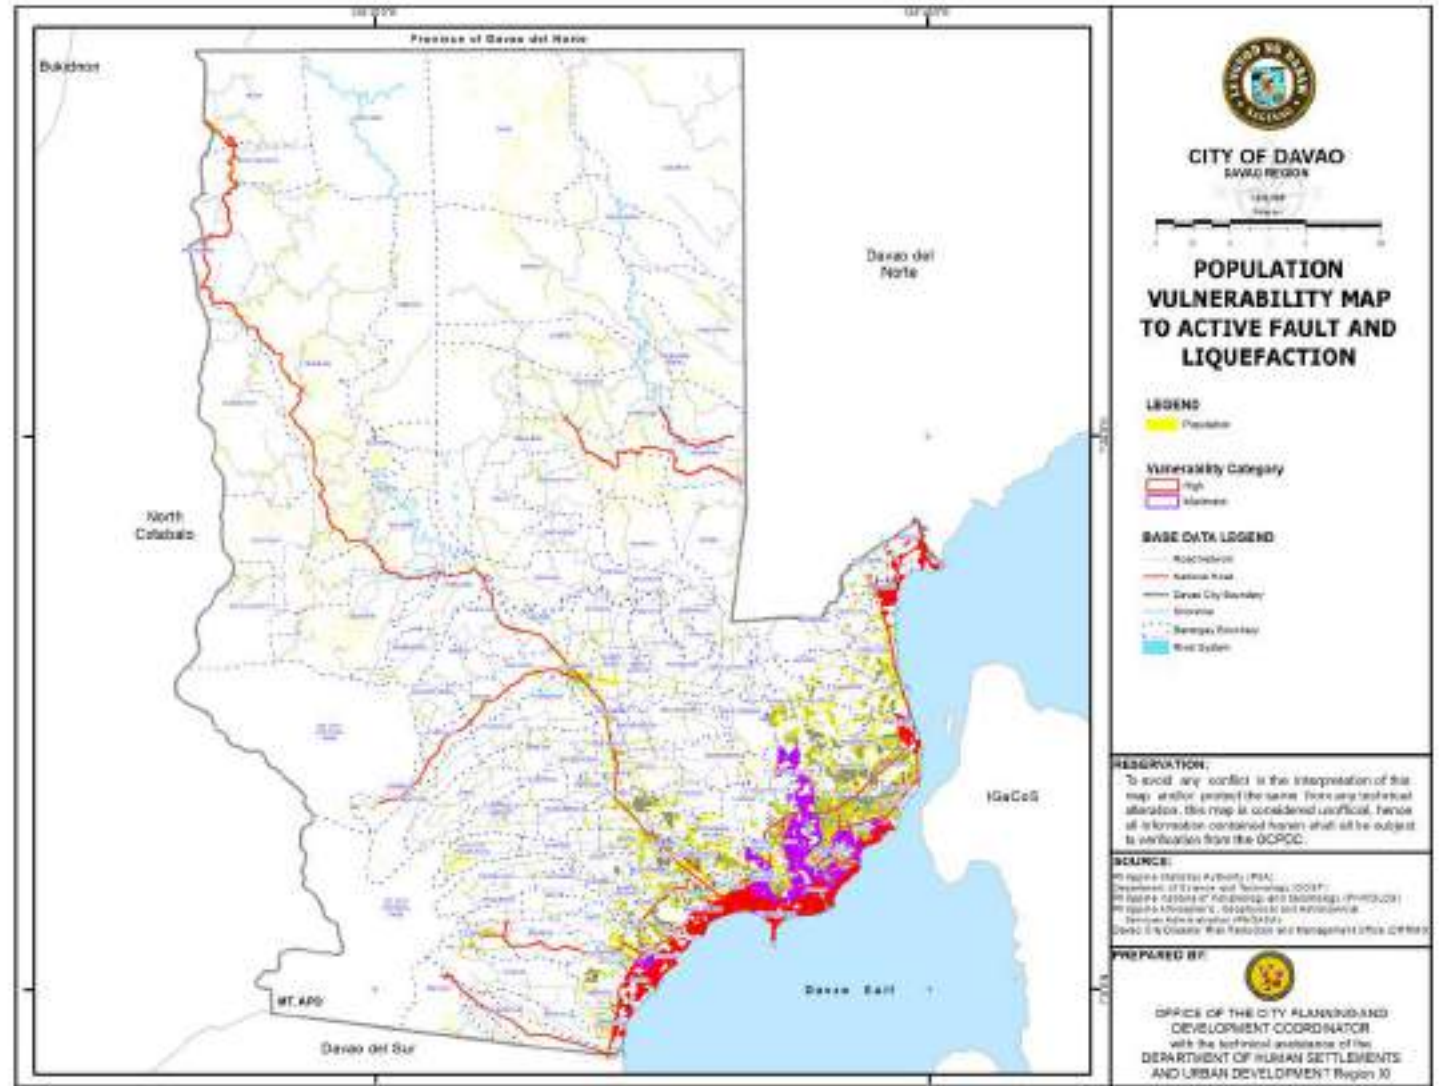

Population Vulnerability Index

Liquefaction – Twenty (20) barangays are highly vulnerable to liquefaction. These areas are expected to experience massive effects whenever there are immense incidences of liquefaction. The exposed population in these areas, which total to 304,927, have also low adaptive capacities.

Results show that the residential areas in Barangays 21-C, 22-C, 23-C, 31-D, and 37-D in Poblacion District, Centro, Gov. Vicente Duterte, and Lapu-Lapu in Agdao District, Lasang, Bunawan Proper, and Panacan in Bunawan District, Bago Aplaya, Bucana, Dumoy, Matina Aplaya, and Talomo Proper in Talomo District, Binugao, Daliao, Lizada, and Sirawan in Toril District are highly vulnerable to liquefaction (Table CP – 23A to Table CP – 23C). These areas are expected to experience massive effects whenever there are immense incidences of liquefaction.

Map 1. 11. Population Vulnerability Map to Active Fault and Liquefaction, Davao City

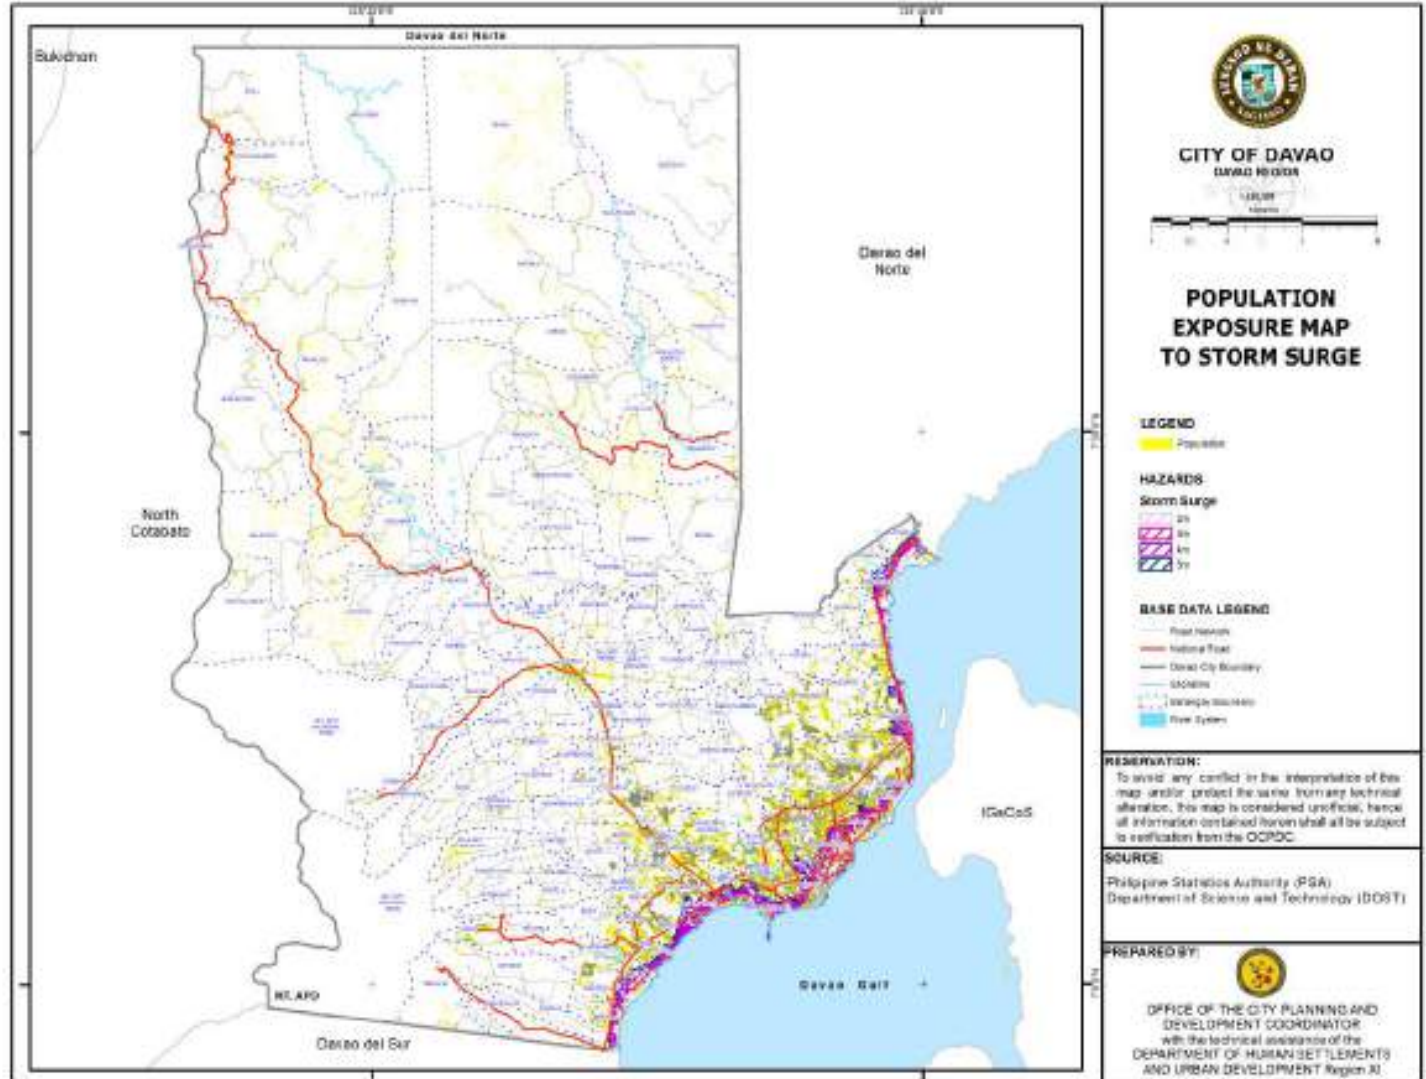

Population Vulnerability Index

Storm Surge - Residential areas of 54 barangays are highly vulnerable to storm surge. The exposed population in these areas, which total to 346,210, also have low adaptive capacities

These barangays include Barangays 1-A, 2-A, 4-A, 5-A, 10-A, 11-B, 12-B, 13-B, 14-B, 15-B, 16-B, 17-B, 18-B, 20-B, 21-C, 22-C, 23-C, 24-C, 25-C, 26-C, 27-C, 28-C, 29-C, 30-D, 31-D, 32-D, 33-D, 34-D, 35-D, 36-D, 37-D, 38-D, 39-D, and 40-D in Poblacion District, Agdao Proper, Centro, Gov. Paciano Bangoy, Gov. Vicente Duterte, Tomas Monteverde, Lapu-Lapu, Leon Garcia Sr., Rafael Castillo, San Antonio, Ubalde, Waan, and Wilfredo Aquino in Agdao District, Lasang and Bunawan Proper in Bunawan District, Bago Aplaya, Bucana, Matina Aplaya, and Talomo Proper in Talomo District, and Daliao and Lizada in Toril District are highly vulnerable to storm surge (Table CP – 24A to Table CP – 24C). These areas are expected to experience massive effects whenever there are immense incidences of storm surge.

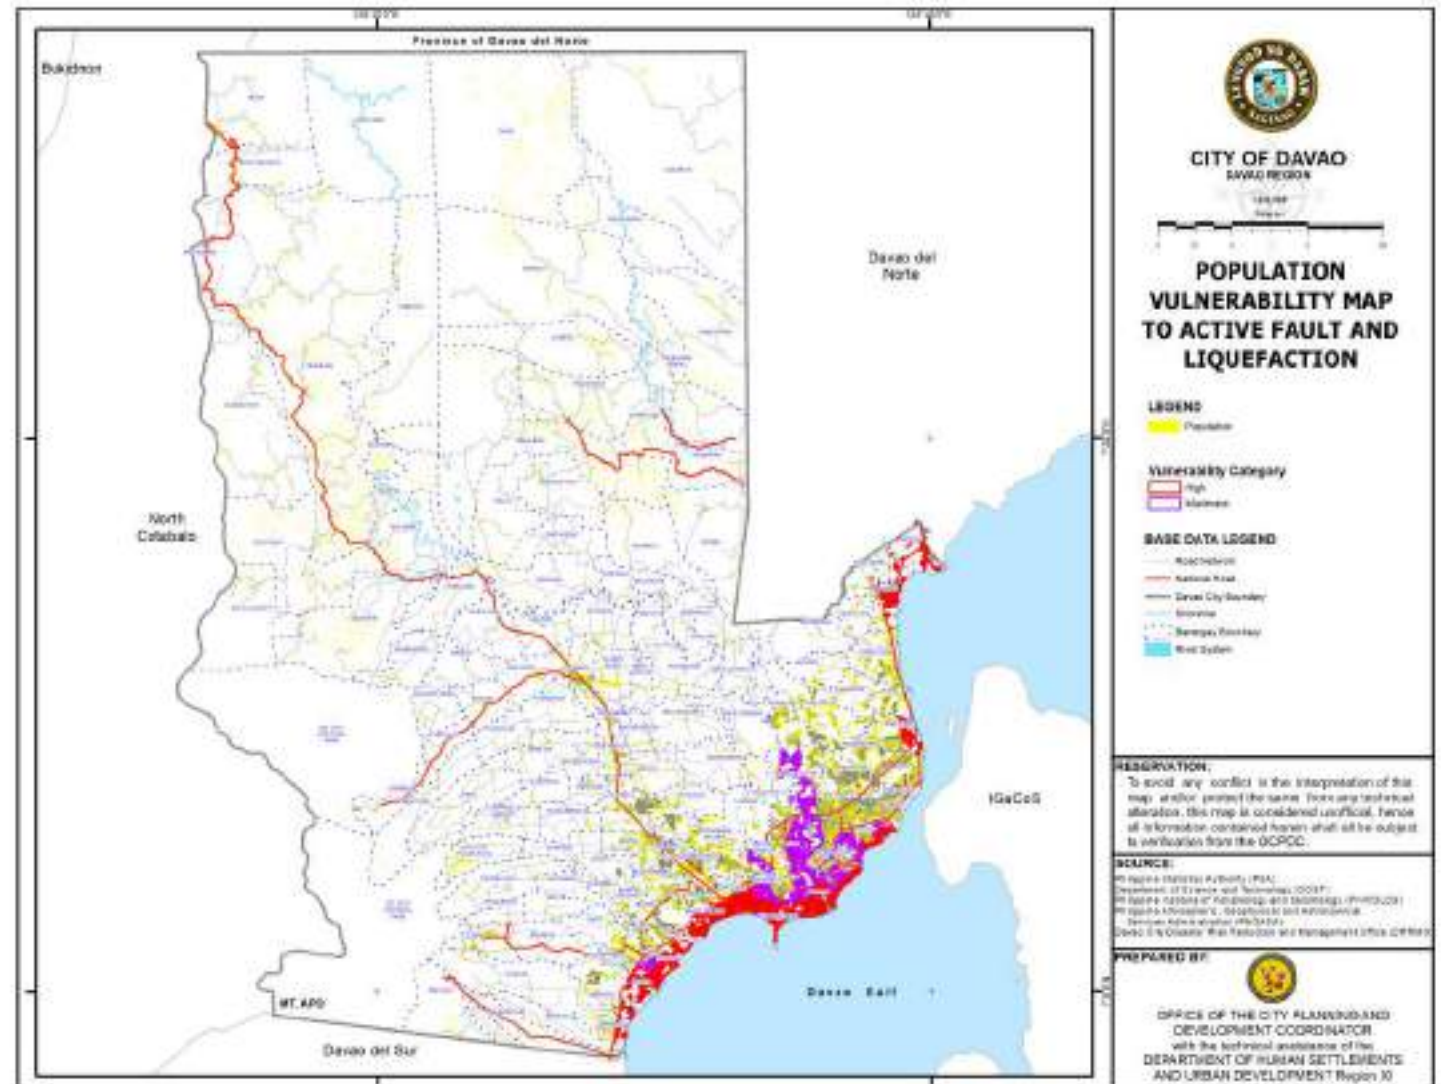

Map 1. 12. Population Vulnerability Map to Storm Surge, Davao City

Population Vulnerability Index

Fault Line - Results show that the residential areas in Barangays Catalunan Pequeno in Talomo District, and Los Amigos, Mintal, and Tugbok Proper in Tugbok District are highly vulnerable whenever there are movements in fault line systems

Map 1. 13. Population Vulnerability Map to Active Fault and Liquefaction, Davao City

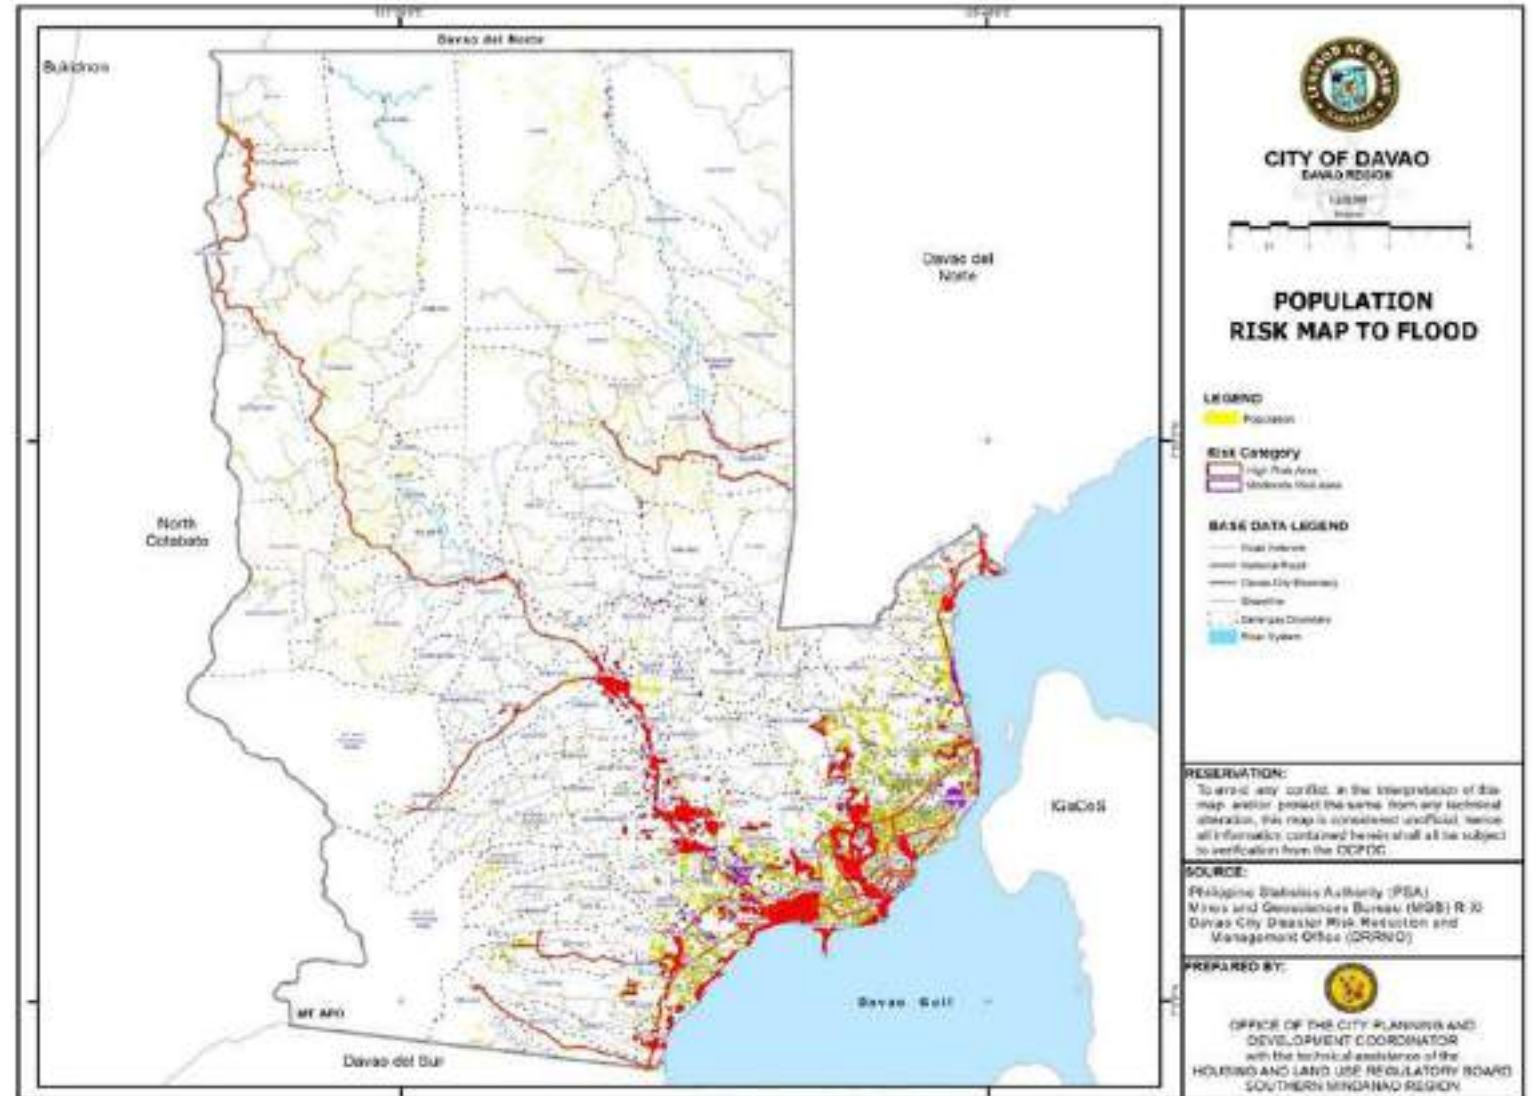

Disaster Risk Assessment for Population Findings

Map 1. 14 Population Risk Map to Flood, Davao City

Flood – Twenty-two barangays are at risk of flood.

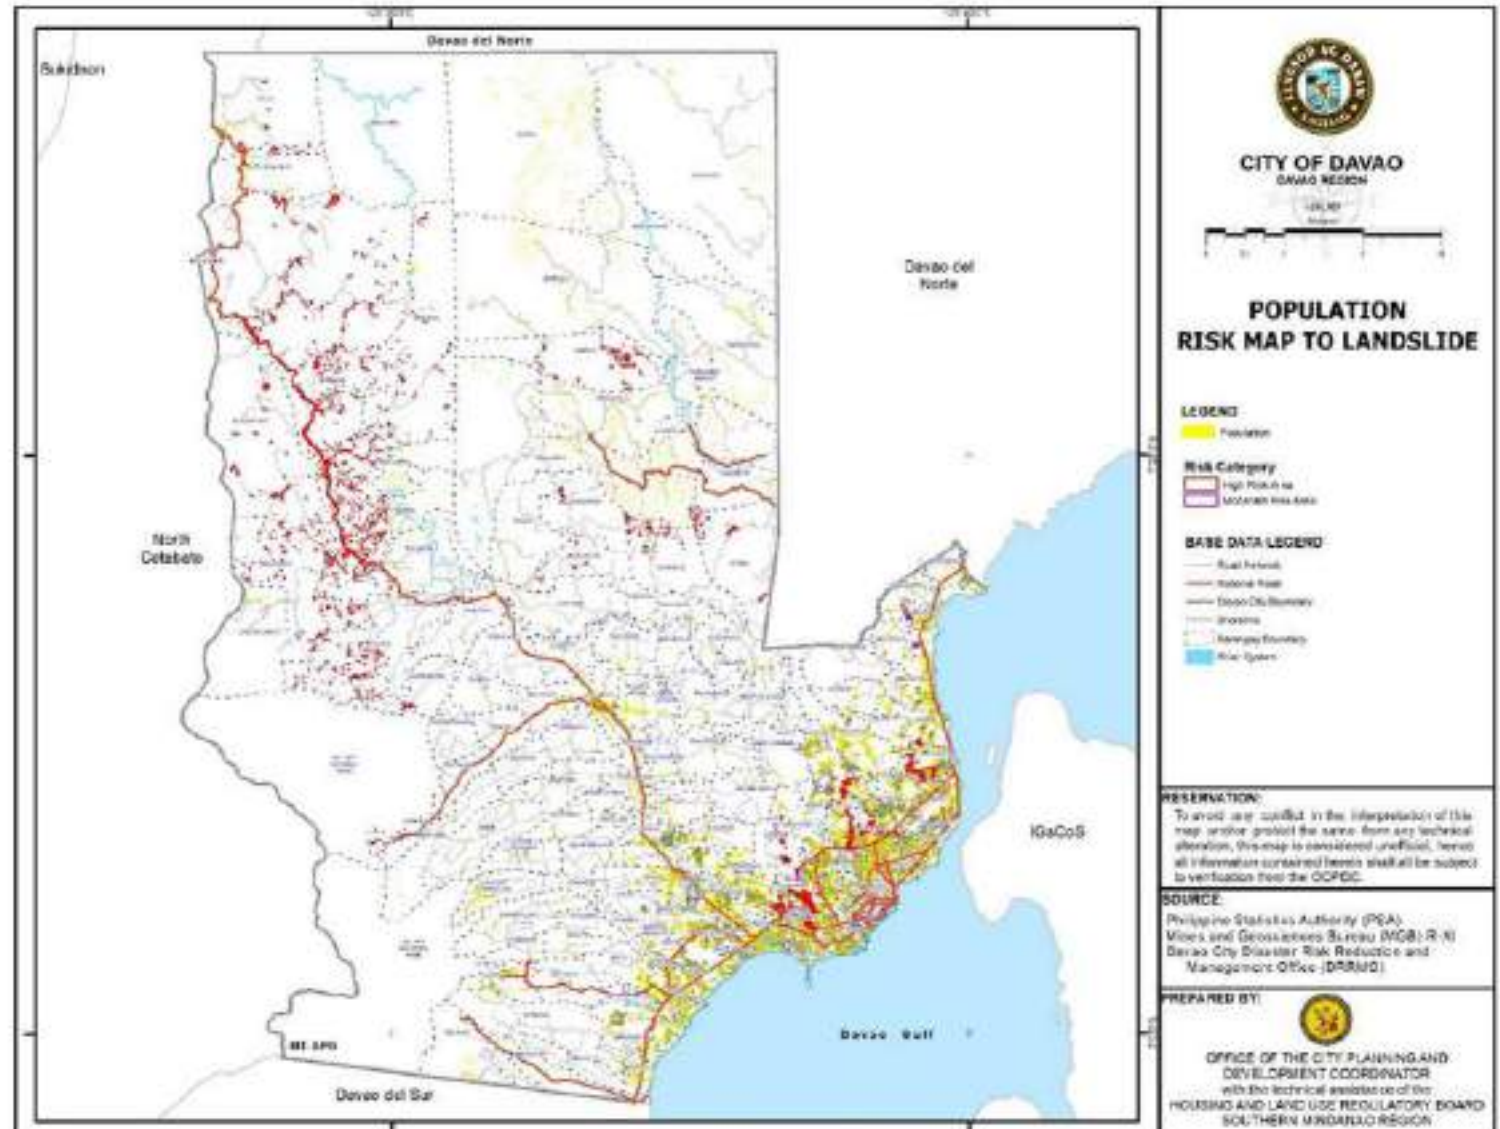

Results of the risk estimation show that Barangays 1-A, 5-A, 6-A, 7-A, 8-A, 9-A, 10-A, 11-B, 19-B, 20-B, Gov. Paciano Bangoy, Calinan Proper, Bago Aplaya, Bucana, Ma-a, Matina Aplaya, Matina Crossing, Matina Pangi, Talomo Proper, Lubogan, Toril Proper, and Tugbok Proper have the highest risk scores ranging from 12 to 24, which depict that these are high risk areas to floods.

Map 1. 15 Population Risk Map to Landslide, Davao City

Landslide- Three (3) barangays: Ma-a, Matina Crossing, and Matina Pangí are at high risk of landslide.

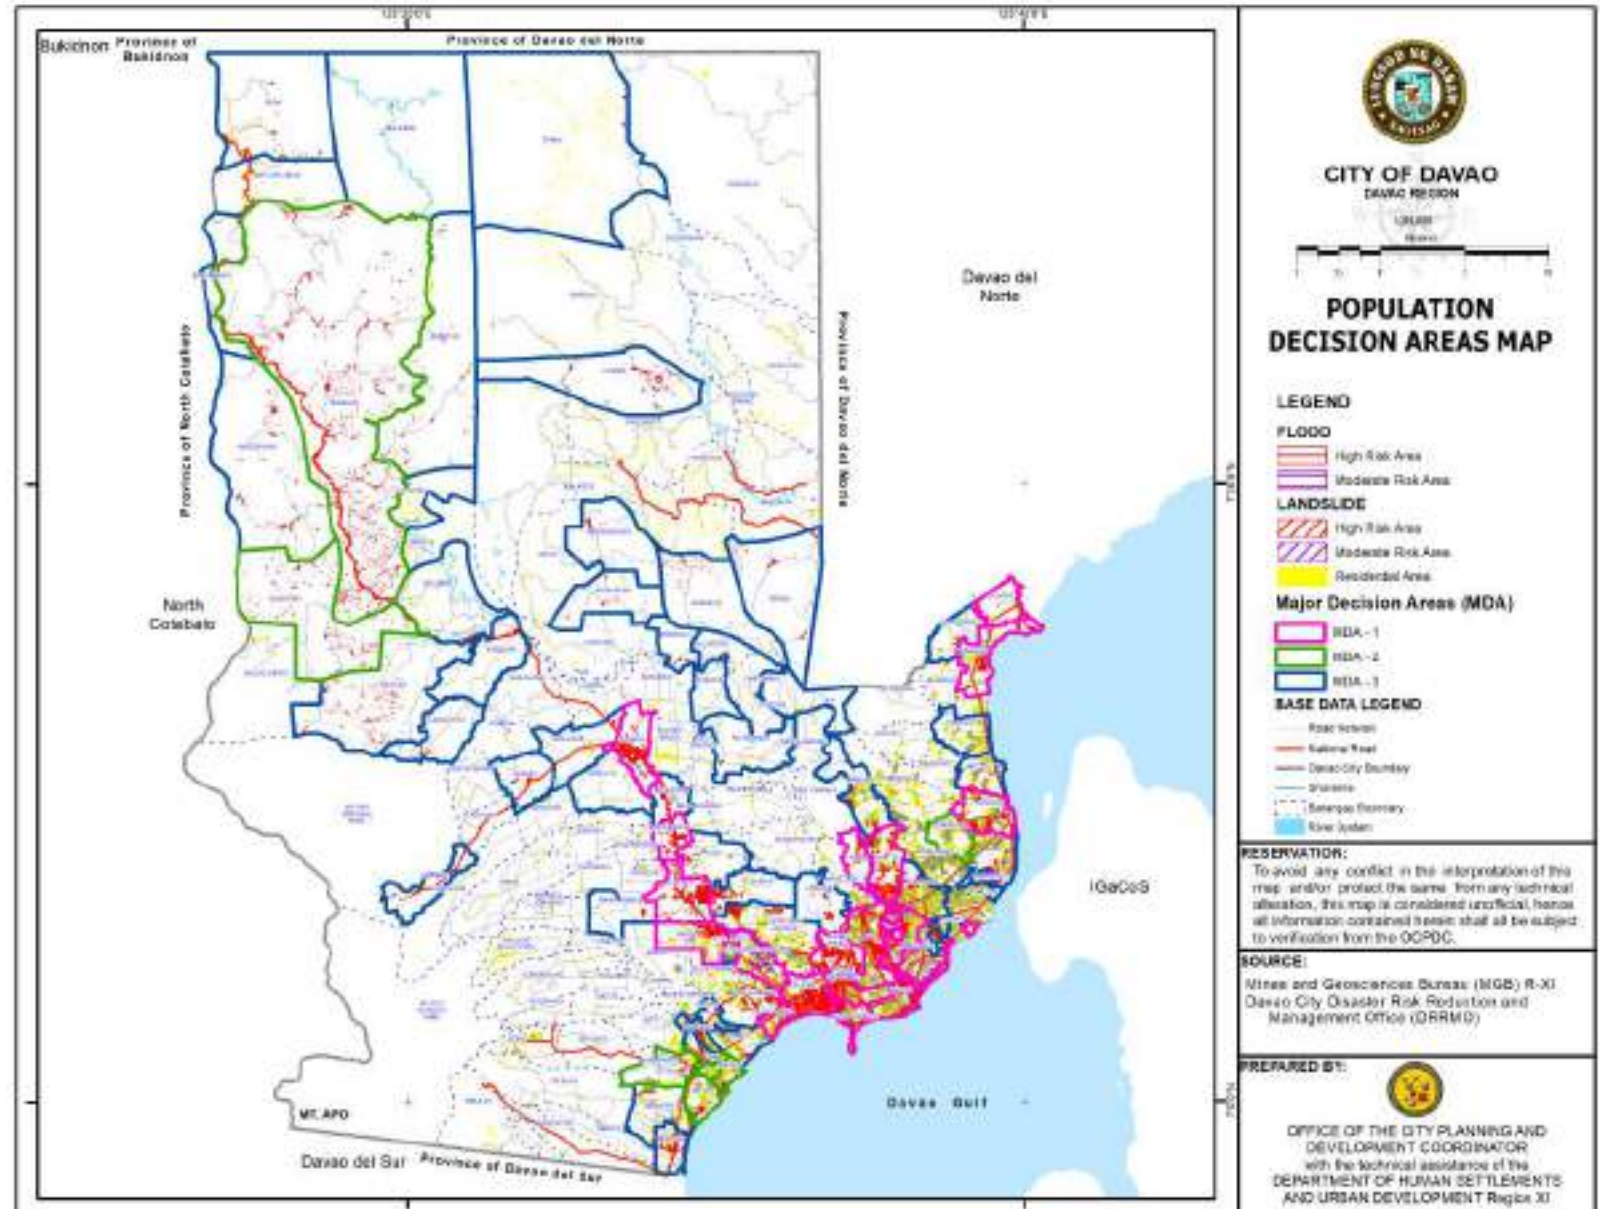

Results of the risk estimation bare that Barangays Ma-a, Matina Crossing, and Matina Pangí have been identified as high risk areas. Vulnerable sectors including informal settlers are present in these barangays, thereby, making these highly at risk whenever there are occurrences of landslides.

Population Major Decision Areas (MDA)

The prioritization varies per level. Those under Major Decision Areas-I shall be the top areas of concern where there are a large number of population. The areas in MDA II shall be the next areas of concern. The last, though shall be also given with priority, are those in MDA III.

Map 1. 16 Population Decision Areas Map, Davao City

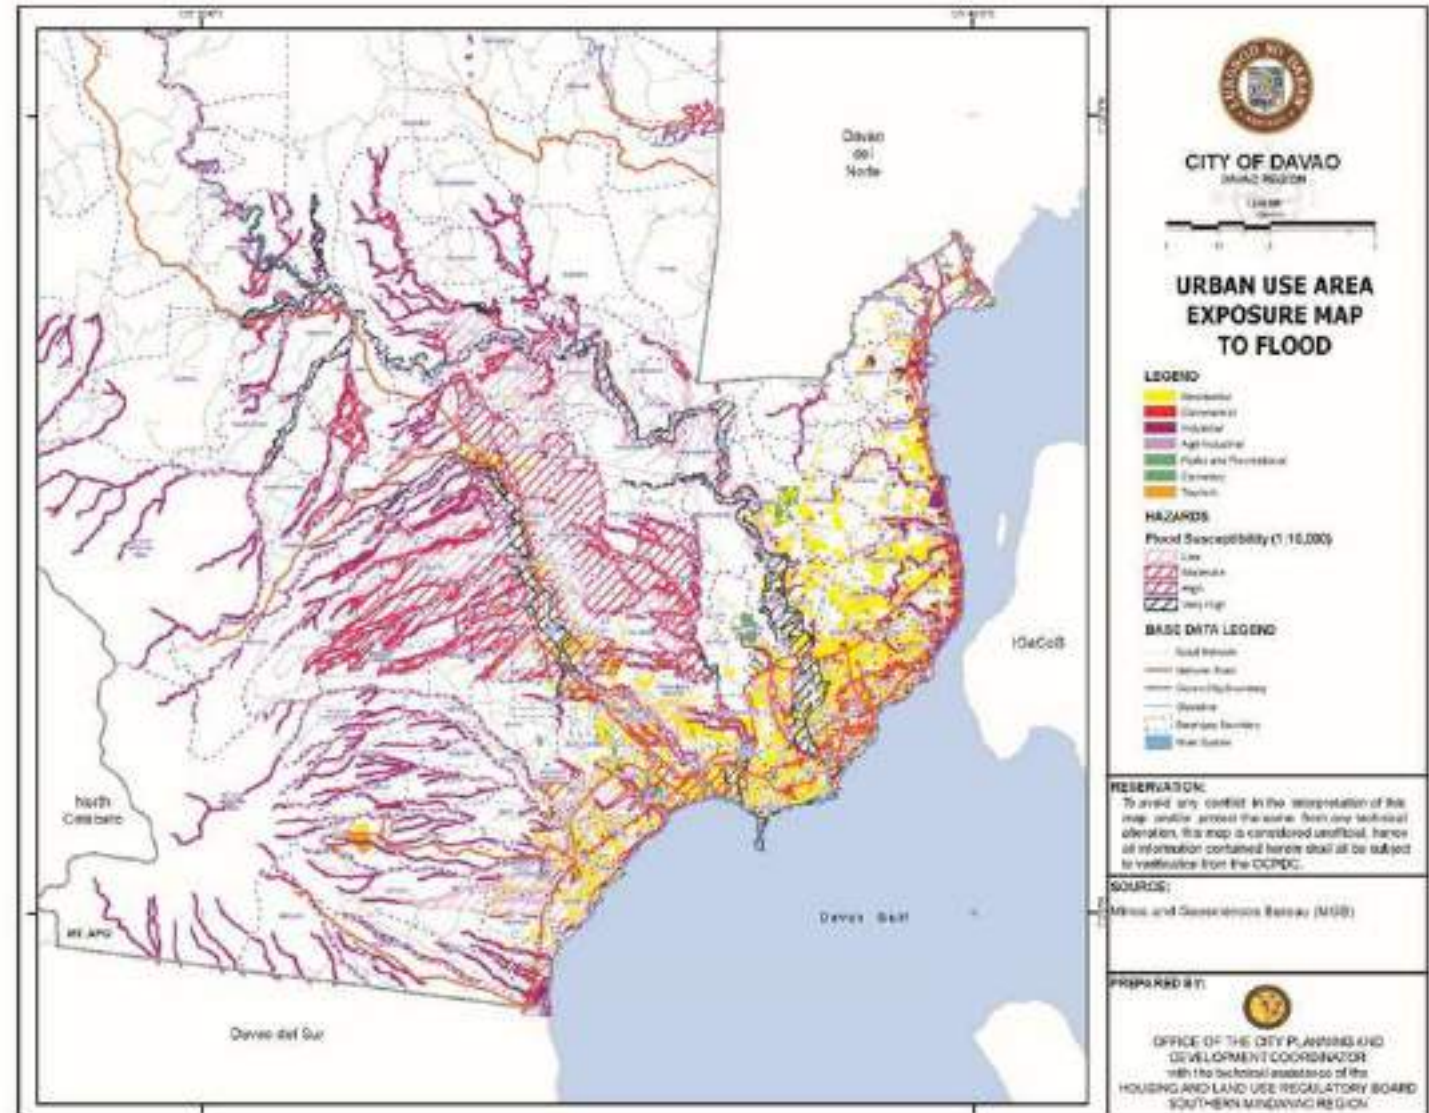

Urban Use Exposure

Flood

- A total of 122 barangays has a land area of 7,852.1 hectares for residential areas, 51 barangays with a land area of 818.13 hectares for commercial use, 45 barangays with 894.22 hectares utilized for industrial use, 37 barangays covering 535.65 hectares used for agri-industrial purposes, 19 barangays with 168.78 hectares for tourism use, eight (8) barangays with 59.99 hectares used as cemetery, and parks and recreation. From these data, a total of 161.40 hectares from 46 barangays are all exposed to flood.
- Through consideration of sensitivity ratings rated using the proportion of buildings in dilapidated/condemned condition as a measure, 39 residential areas have very high sensitivity rating and 38 residential areas have high sensitivity rating.
- All 122 residential areas do not have the capacity and willingness to retrofit or relocate or conform with new regulations though there are identified alternative sites. The rest of the land uses are all capable and are willing to retrofit, relocate and conform to new regulations, though for most there are no available alternative sites yet.

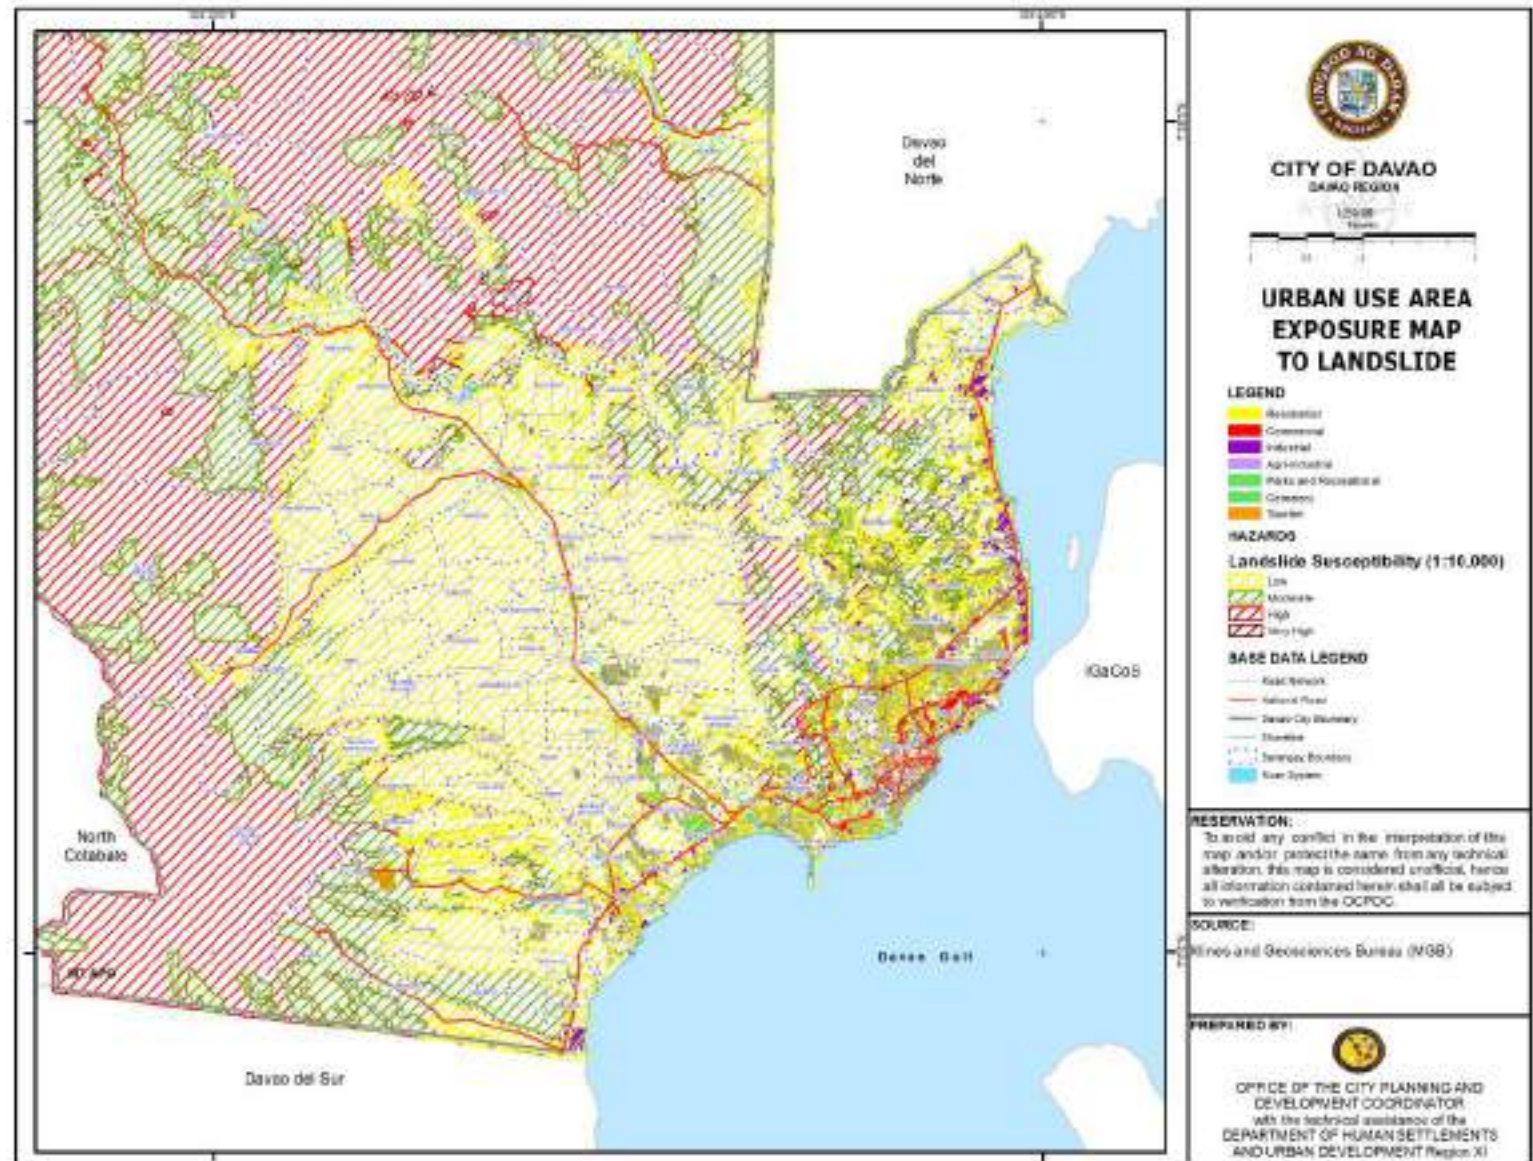

Map 1. 17 Urban Use Area Exposure Map to Flood, Davao City

Landslide

- A total of 90 barangays with residential areas totalling 5,276.99 hectares, 14 barangays with a land area of 297.32 hectares utilized for commercial purposes, 20 barangays with 635.05 hectares for industrial use, 18 barangays with combined land area of 315.02 hectares used for agri-industrial activities, 16 barangays with 200.75 hectares for tourism, five (5) barangays with 130.23 hectares of land for cemetery, and 12 barangays with 122.19 hectares used as parks and recreation areas are all exposed to landslide.
- Through consideration of sensitivity rating, rated using the proportion of buildings in dilapidated/condemned condition as a measure, 44 barangays mainly with residential have high sensitivity rating.
- Most if not all residential areas are not capable and are not willing to retrofit and relocate or conform with new regulations even if there are available alternative sites; while most parks and recreation, commercial, industrial, agri-industrial, tourism are willing to retrofit and relocate. The downside though is there are still no available alternative sites.

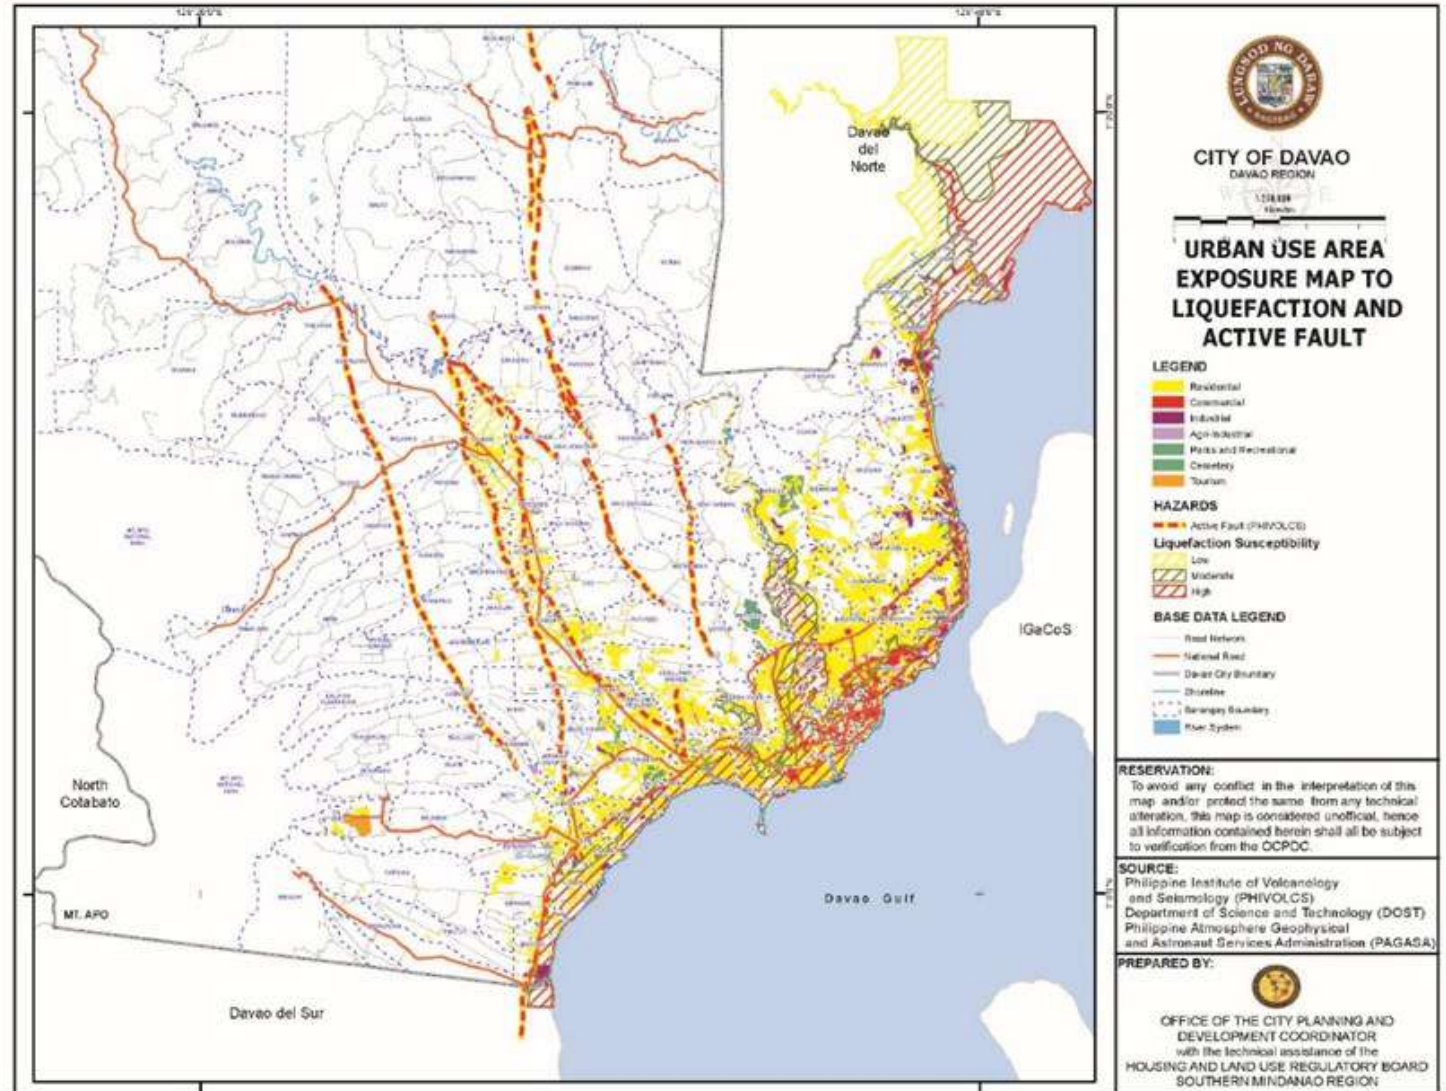

Map 1. 18 Urban Use Area Exposure Map to Landslide, Davao City

Liquefaction

- Residential areas of 84 barangays with a total land area of 5,554.45 hectares, commercial areas of 66 barangays with 990.73 hectares, industrial areas of 49 barangays with land area totalling 792.15 hectares, agri-industrial areas of 7 barangays with 123.15 hectares, tourism areas of 13 barangays with a land area of 34.92, three (3) barangays with a land area of 45.63 hectares used as cemetery, and parks and recreation areas of 27 barangays with a land area of 36.07 hectares are all exposed to liquefaction.
- Through consideration of sensitivity rating, rated using the proportion of buildings in dilapidated/condemned condition, it was found that residential areas in 19 barangays have very high sensitivity rating, while 26 residential areas also have high sensitivity rating.
- In terms of adaptive capacity, residential areas exposed have no capacity and are not willing to retrofit or relocate or conform with new regulations though there are identified relocation sites. Exposed commercial, agri-industrial, tourism, and parks and recreation areas have the capacity to retrofit and relocate but areas for relocation are yet to be identified.

Map 1. 19 Urban Use Area Exposure Map to Liquefaction and Active Fault, Davao City

Fault Line

- Data in the table below reveals the following barangays exposed to fault line: 25 barangays with a total of 1,827.78 hectares designated for residential use; four (4) barangays with 25.11 hectares allocated for commercial use, two (2) barangays with a 69.72 hectares for industrial, nine (9) barangays with 230.74 hectares for agri-industrial, two (2) barangays with 1.95 hectares for tourism, three (3) barangays with 2.90 hectares, and a barangay with 3.97 hectares utilized as cemetery.
- Through consideration of sensitivity rating, rated using the proportion of buildings in dilapidated/condemned condition, it was found that a total of 16 barangays with residential areas have high sensitivity rating.
- In terms of adaptive capacity, residential areas exposed have no capacity and are not willing to retrofit or relocate or conform with new regulations though there are identified relocation sites. Exposed commercial, agri-industrial, tourism, and parks and recreation areas have the capacity to retrofit and can relocate but areas for relocation have yet to be identified.

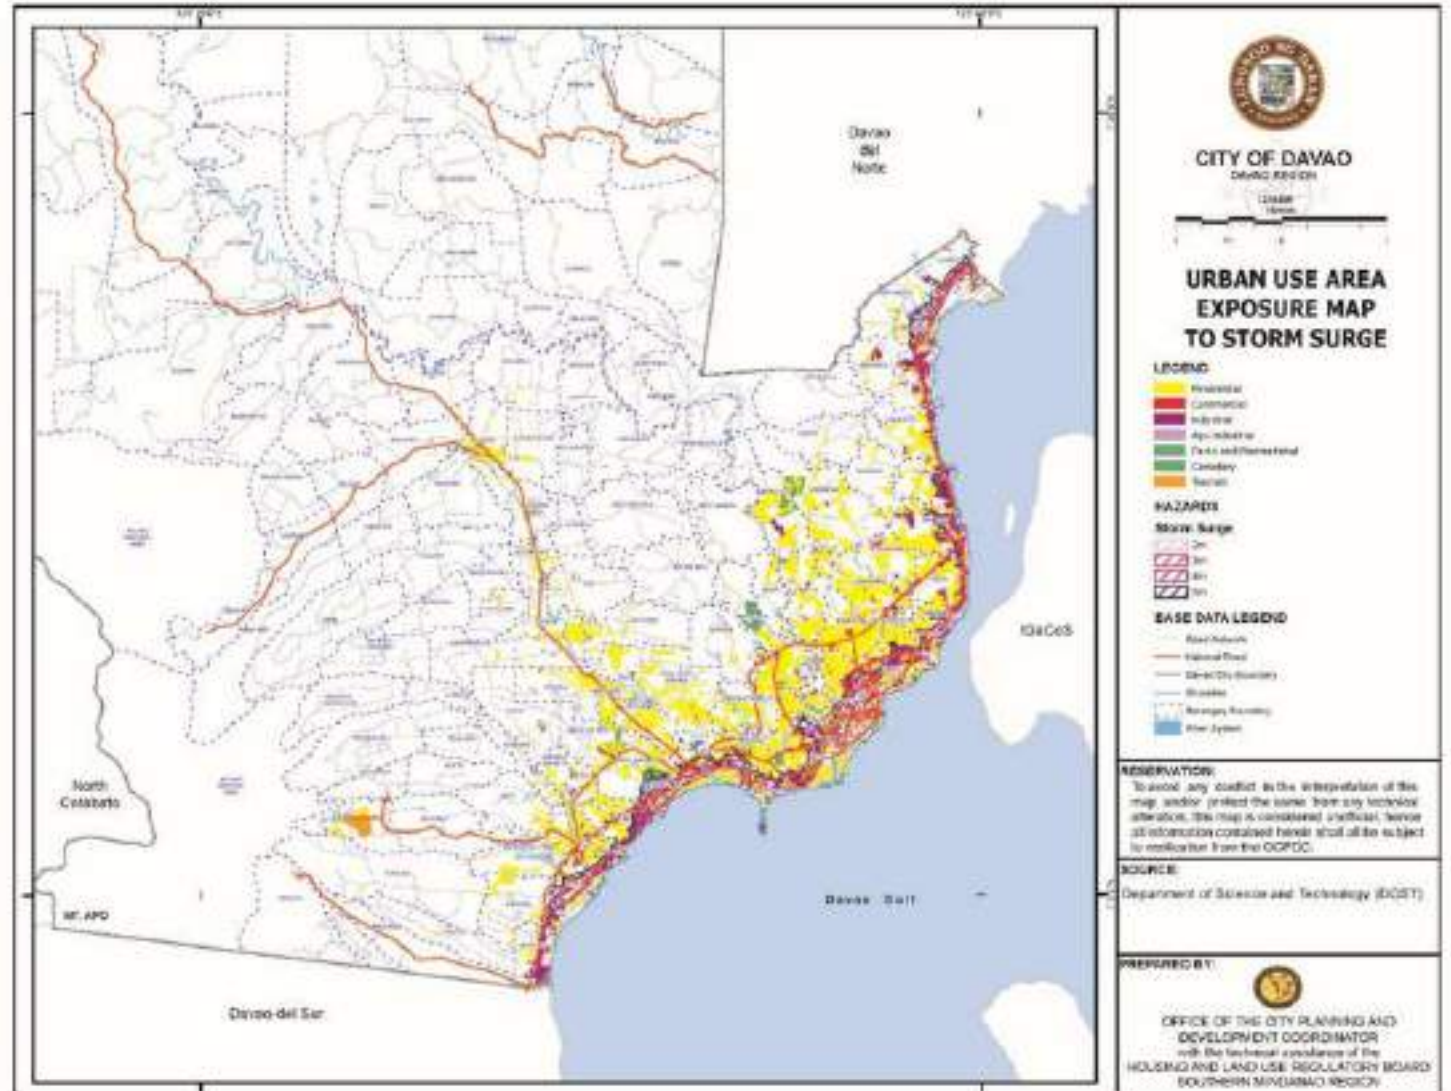

Map 1. 20 Urban Use Area Exposure Map to Liquefaction and Active Fault, Davao City

Storm Surge

- A total of 3,666.32 hectares of residential areas from 72 barangays, 1,126.60 hectares of commercial areas from 65 barangays, 880.83 hectares of industrial use from 39 barangays, a 1.86 hectares of land from a barangay utilized for agri-industrial use, 17.77 hectares from 10 barangays designated for tourism use, and 122.28 hectares from 41 barangays used as parks and recreation are all exposed to storm surge.
- Taking into account sensitivity rating, rated through assessment of proportion of buildings in dilapidated/condemned condition as a measure, there are a total of 17 residential areas with very high sensitivity, 22 residential areas with high sensitivity.
- In terms of adaptive capacity, residential areas exposed have no capacity and are not willing to retrofit or relocate or conform with new regulations though there are identified relocation sites. Exposed commercial, agri-industrial, tourism, and parks and recreation areas have the capacity to retrofit and relocate but areas for relocation have yet to be identified.

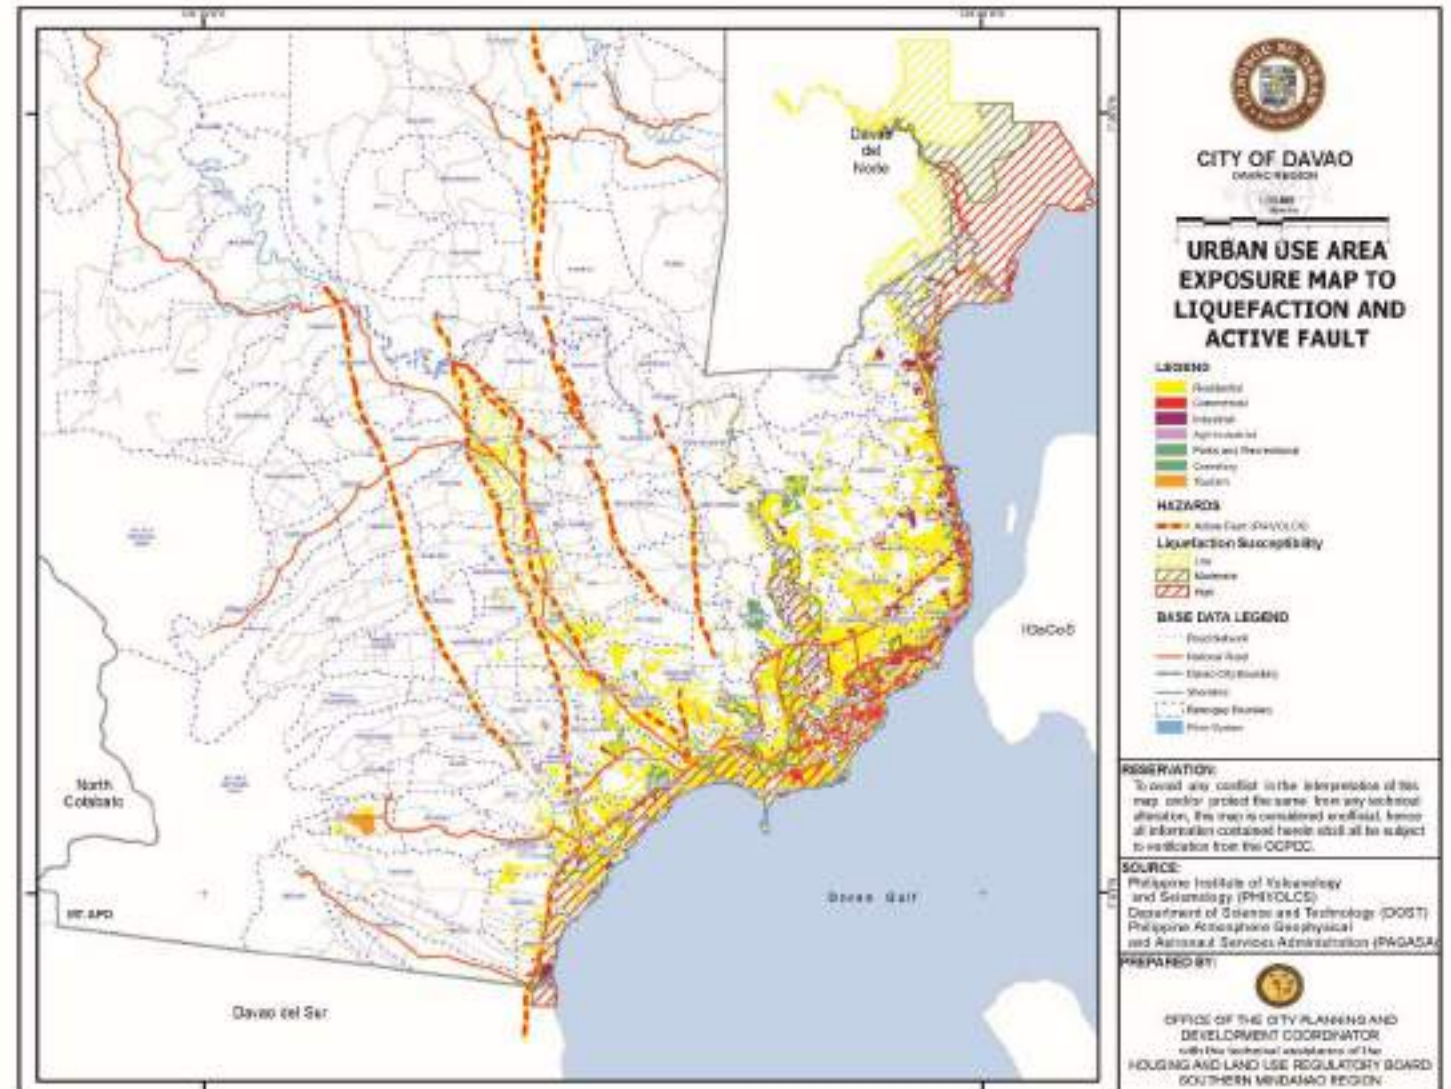

Map 1. 21 Urban Use Area Exposure Map to Storm Surge, Davao City

Urban Use Areas Exposure to Liquefaction

- Residential areas of 84 barangays with a total land area of 5,554.45 hectares, commercial areas of 66 barangays with 990.73 hectares, industrial areas of 49 barangays with land area totaling 792.15 hectares, agri-industrial areas of 7 barangays with 123.15 hectares, tourism areas of 13 barangays with a land area of 34.92, three (3) barangays with a land area of 45.63 hectares used as cemetery, and parks and recreation areas of 27 barangays with a land area of 36.07 hectares are exposed to liquefaction.
- Taking into account sensitivity, the proportion of buildings in dilapidated/condemned condition were considered, 19 barangays have very high sensitivity rating and 26 have sensitivity high rating with residential as main use.
- In terms of adaptive capacity, residential areas exposed have no capacity and are not willing to retrofit or relocate or conform with new regulations though there are identified relocation sites. Exposed commercial, agri-industrial, tourism, and parks and recreation areas have the capacity to retrofit and relocate but areas for relocation are yet to be identified.

Map 1. 22 Urban Use Area Exposure Map to Liquefaction and Active Fault, Davao City

Urban Use Areas Degree of Impact

Flood

A percentage 77.63 of the total exposed barangays has the highest degree of impact among the urban use areas exposed to flood. These identified barangays have a total area of 4,750.60 hectares wherein a 25.16% of the total area is highly susceptible to hazard which corresponds to an exposed value of Php 12,234,500,000. The top three (3) barangays with a high degree of impact for flood are residential areas in Talomo, Ma-a, and Tugbok with 226.76 hectares, 136.31 hectares, and 107.98 hectares land area respectively. Exposed values are pegged at P2,267,600,000, P1,363,100,000, and P 1,079,800,000.

Landslide

Out of the 90 barangays with residential use susceptible to landslide, 69 barangays have the highest degree of impact score. These identified barangays have a total area of 3,882.25 hectares which 28.44% of it is exposed to landslide. Exposed value is pegged at Php 114,041,000,000. Residential sections in Ma-a, Matina Pangi, and Cabantian with exposed land areas of 101.76, 64.73, and 83.13 respectively are the top three barangays registered with high impact to landslide. The exposed value of the residential area in Ma-a is P10,176,000,000; Matina Pangi is P9,709,500,000; and Cabantian at P8,313,000,000.

Liquefaction

Residential, commercial, and industrial urban uses have high degree of impact for liquefaction. As per evaluation, 70 out of 75 barangays with residential use have the highest score of 3 for the degree of impact. The percentage of exposure from the total area of residential use in the identified barangays is at 48.5%. Moreover, commercial uses in 70 barangays have also high degree of impact covering 82% of the 927.01 hectares total area of the identified barangays. Lastly, for the industrial uses with high degree of impact for liquefaction is present in 40 barangays. Such areas which could take on a lot of damage cover 57.7% of the 902.73 hectares total land area of barangays susceptible to liquefaction. Exposed values of each identified areas (residential, commercial, and industrial) are Php 242,333,145,766.65, Php 113,995,599,455.82, and Php 78,196,203,399.46, respectively.

Urban Use Areas Degree of Impact

Storm Surge

The top three urban use areas with a high degree of impact residential, commercial and industrial area. As per evaluation, only one barangay with residential use susceptible to liquefaction did not have high degree of impact. Same holds true in commercial area wherein 64 out of 65 exposed barangays have high degree of impact. In industrial area, 36 out of 39 barangays susceptible to storm surge have high degree of impact. As for the residential area, the total area of the 71 barangays measures up to 3,616.34 hectares wherein 36.71% is expected to take greater damage from storm surge with a corresponding exposed value of Php 134,806,687,845.64. On the other hand, damage in exposed commercial areas may reach up to P80, 491,650,929.35 as areas with high degree of impact take up 61% of the 879.25 hectares total commercial area of barangays identified. Lastly, the industrial areas with high degree of impact take up 41.6% of the total area industrial area of barangays affected with expected damage cost of Php 49,070,553,869.38.

Fault Line

As per data evaluation, 4 (four) out of the 25 barangays located in the residential area which are susceptible to active fault have a degree of impact score of 3, which is the highest score among the urban use areas. The four barangays have a total land area of 438.05 hectares in which 0.67% of it is highly exposed to the hazard. Exposed value is set at Php 294,951,425.

Urban Use Adaptive Capacity

<p>Flood</p> <ul style="list-style-type: none"> • Of the 328 barangays exposed to flood, 231 are registered to have a low adaptive capacity to mitigate the effects of flooding. • Capacities vary on the three (3) variables indicated below in terms of: <ol style="list-style-type: none"> a. Capacity and willing to retrofit or relocate or conform to new regulations. b. Insurance coverage c. Available alternative sites. • Most of the 231 barangays have available government resources at their disposal and are empowered to implement zoning regulations. • Among the top three (3) barangays whose residential areas have low adaptive capacity are 1-A, 2-A, 5-A. For areas, are Barangay 1-A, 2-A and 8-A. • Also identified as areas with low adaptive capacity are as follows: <ol style="list-style-type: none"> a. Areas allocated for industrial in barangays 8-A, Agdao Proper, and Paciano Bangoy; b. Parks and recreation in 23-C, 27-C, and Panacan; c. Agri-industrial areas in Baguio, Mandug, and Lasang; d. Areas utilized as cemetery in Barangays 8-A, Calinan, and Riverside; e. and Tourism areas in Panacan and Dumoy. 	<p>Landslide</p> <ul style="list-style-type: none"> • At least 175 barangays are exposed to landslide, with 137 exhibiting a low adaptive capacity to handle the impact. In terms of residential areas, top three areas are barangays 19-B, Carmen, and Tambobong, while for agri-industrial use areas, these are in barangays Gumalang, Malagos, and Gatungan. • Also identified are the top areas with low adaptive capacity are as follows: <ol style="list-style-type: none"> a. Areas allocated for tourism use in Communal, Megkawayan, and Baganihan; b. industrial use in Buhangin, Cabantian, and Communal; c. parks and recreation in Indangan, Mandug, Langub, d. and cemetery in Buhangin and Ma-a <p>Liquefaction</p> <ul style="list-style-type: none"> • Over-all, there are 280 barangays which are exposed to liquefaction. • Of the total, 83 barangays with land utilized as residential have exhibited a low adaptive capacity to meet the effects of liquefaction, with an adaptive capacity score equivalent to three (3). <p>Storm Surge</p> <ul style="list-style-type: none"> • There are 227 barangays exposed to storm surge and 72 of these have low adaptive capacity. The exposed areas are all residential in use.
<p>Fault line</p> <ul style="list-style-type: none"> • Overall, there are 25 barangays located in fault line areas which registered a low adaptive capacity and an adaptive capacity average equivalent to three (3) in dealing with the impact of an earthquake. • Enumerated below are the top barangays per land use category: For residential use these are Malagos, Calinan, and Pangyan; for agri-industrial use are Biao Joaquin, Cawayan, and Talomo River; for commercial use areas are Calinan, Riverside, and Los Amigos; for parks and recreation are in Mintal and Tagakpan, and for cemetery use in Tugbok. 	

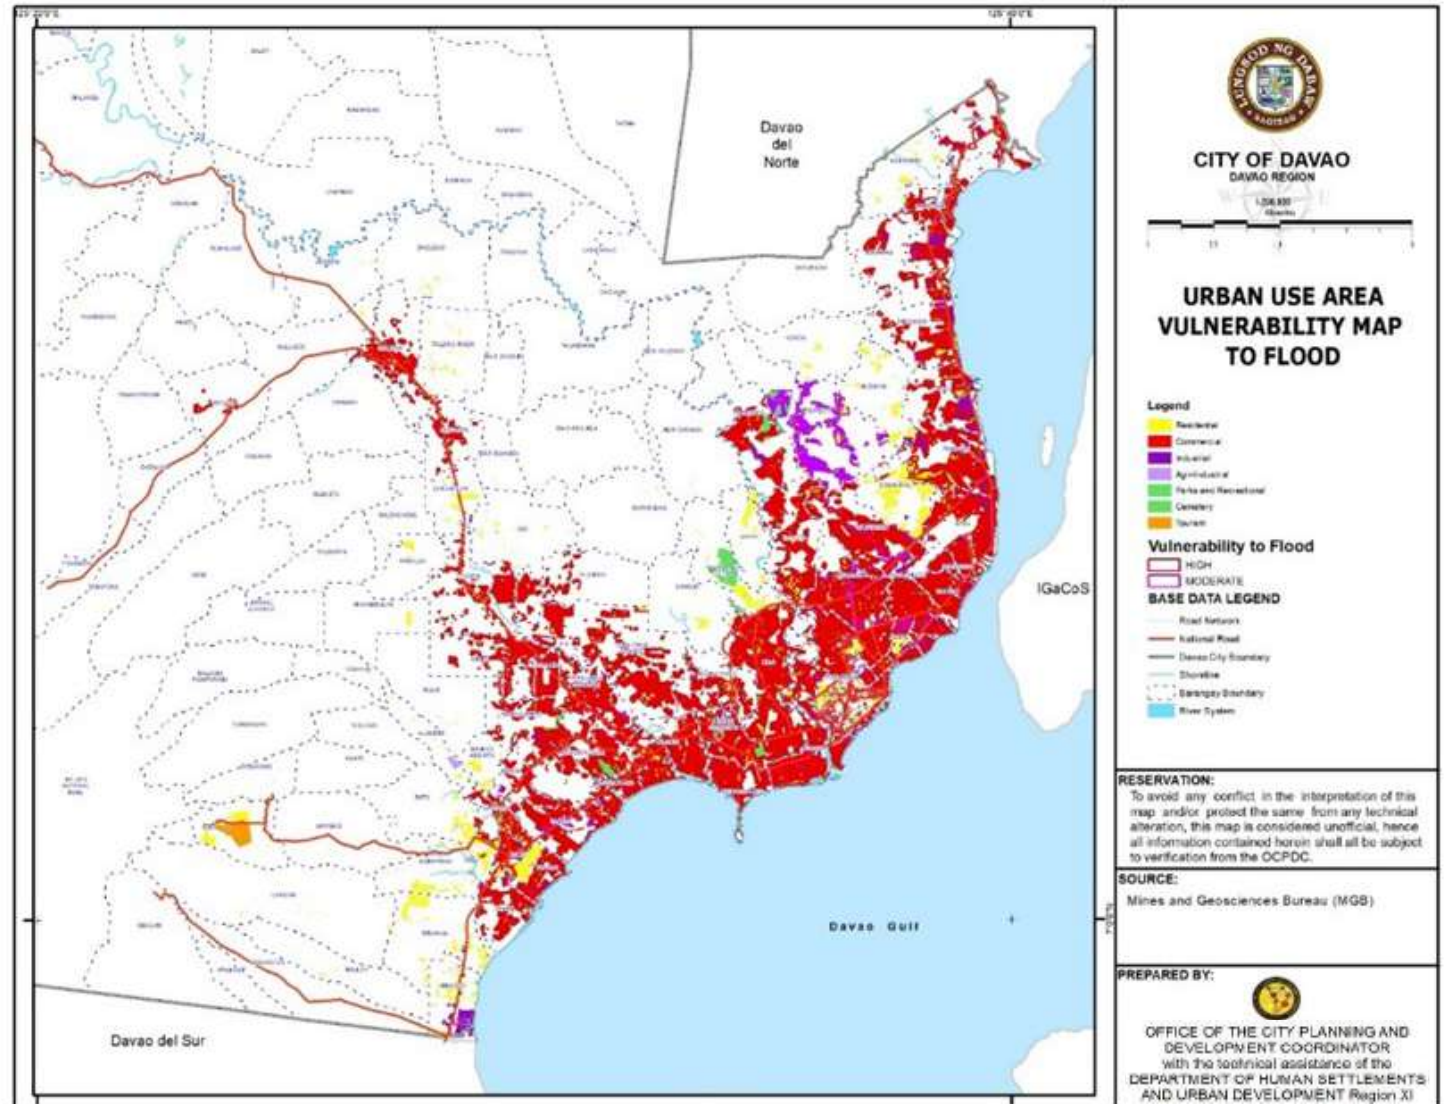

Very High—>50%; High >30-50%; Moderate > 15-30%; Low >5-15%; Very Low >2-5%; Residual >0-2%

Degrees of Impact are categorized into three: high, moderate and low. High degree impact has a designated impact score of 3, and Moderate has a designated impact score of 2, both in terms of estimated number of fatalities, injuries and value of property damage. For high degree of impact, the overall impact will be disastrous given the extent of exposure and current sensitivity of the system, while moderate degree of impact are expected given the exposure and current sensitivities of the system. For the low degree of impact, which has a designated impact score of 1, estimated direct and indirect impacts are low to negligible which can be felt within a short term of period. There is minimal impact to development processes and no significant cost needed to return to pre-impact levels.

Urban Use Vulnerability Index

Flood- There are 231 barangays with high vulnerability impact to flood which are mainly residential in use while at least 69 barangays have moderate impact and are mainly used as park and recreation, and another 28 barangays, with low impact utilized for residential use.

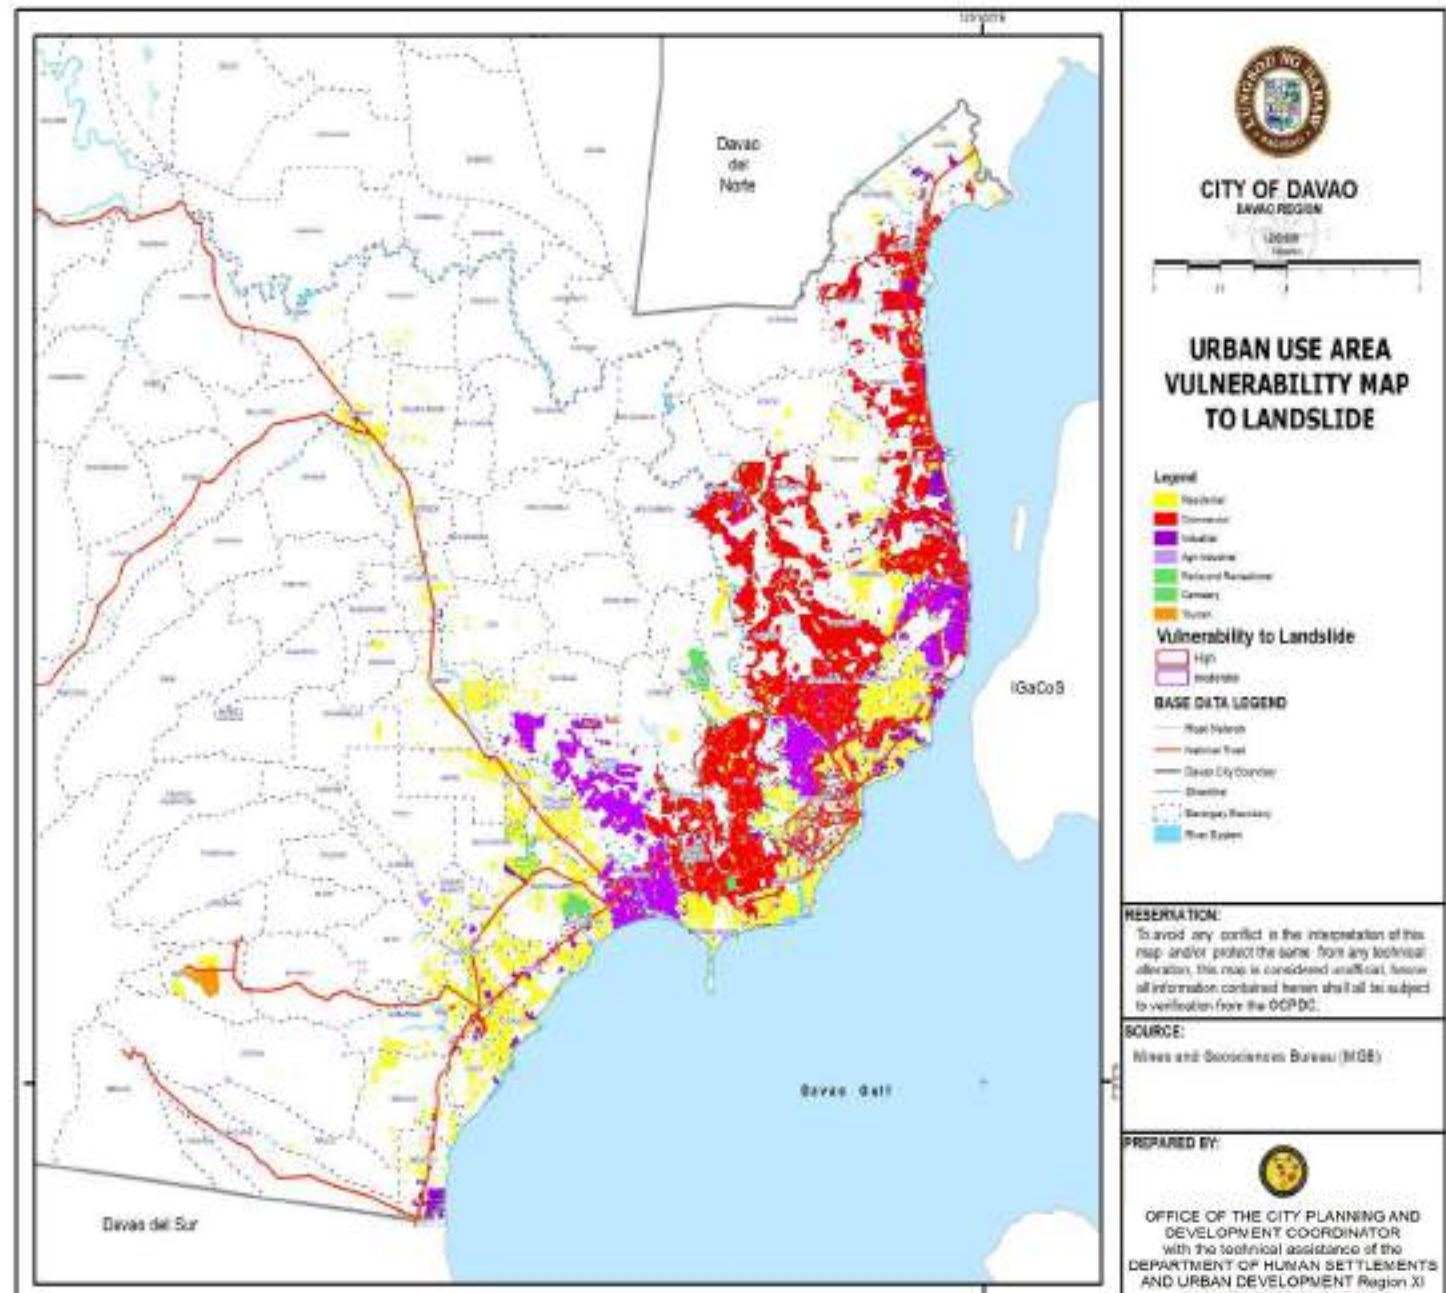

Map 1. 23 Urban Use Area Vulnerability Map to Flood, Davao City

Urban Use Vulnerability Index

Landslide— There are 123 barangays with high vulnerability to landslide impact, 38 barangays with moderate impact, and 14 barangays with low impact. Dominant use for all these are residential.

Map 1. 24 Urban Use Area Vulnerability Map to Landslide, Davao City

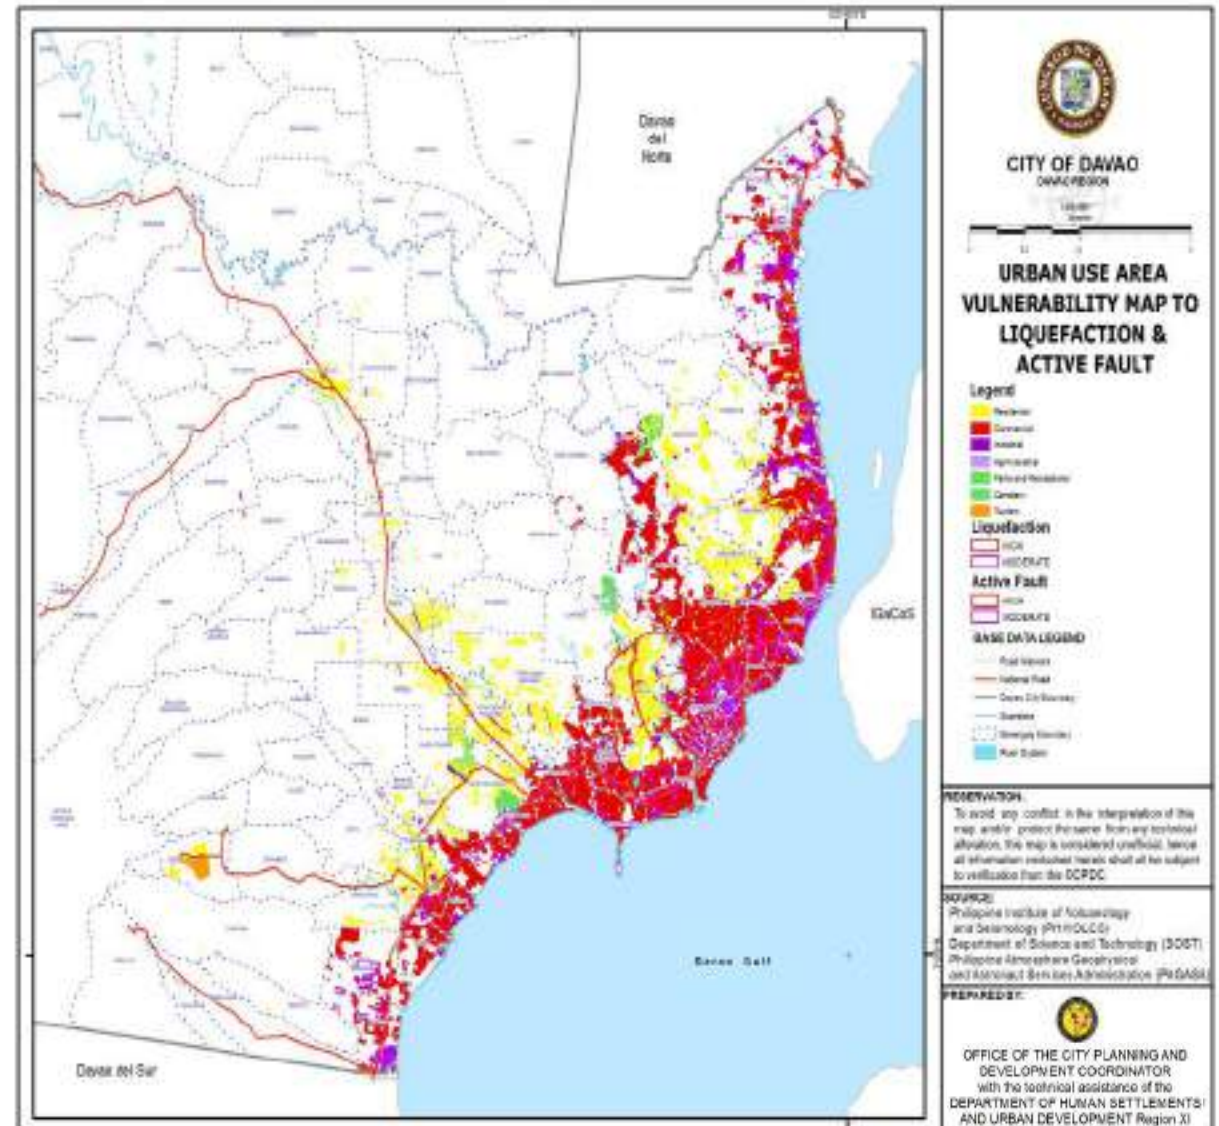

Urban Use Vulnerability Index

Liquefaction- According to the presented result from the urban use assessment for vulnerability, only the residential area in 79 barangays have high vulnerability to liquefaction. Based on the table, these barangays have “low rating” on structure employing hazard resistant/adaptation design and a “very high” rating on no access/area coverage to infrastructure related hazard mitigation. While this is the reality among the structures, findings also disclose that 40 barangays have “high” to “very high” rating on the proportion of buildings with walls with light to salvageable materials and this number also equals to number of barangays with “high” to “very high” proportion of buildings in dilapidated/condemned condition. What makes this barangays an area of concern to liquefaction is that the same barangays have low adaptive capacity, having no capacity and willingness to retrofit or relocate or conform to new regulations and no insurance coverage. Hence, the presence of liquefaction hazard can further be addressed by implementation of zoning regulations, identification of alternate sites and utilization of government resources.

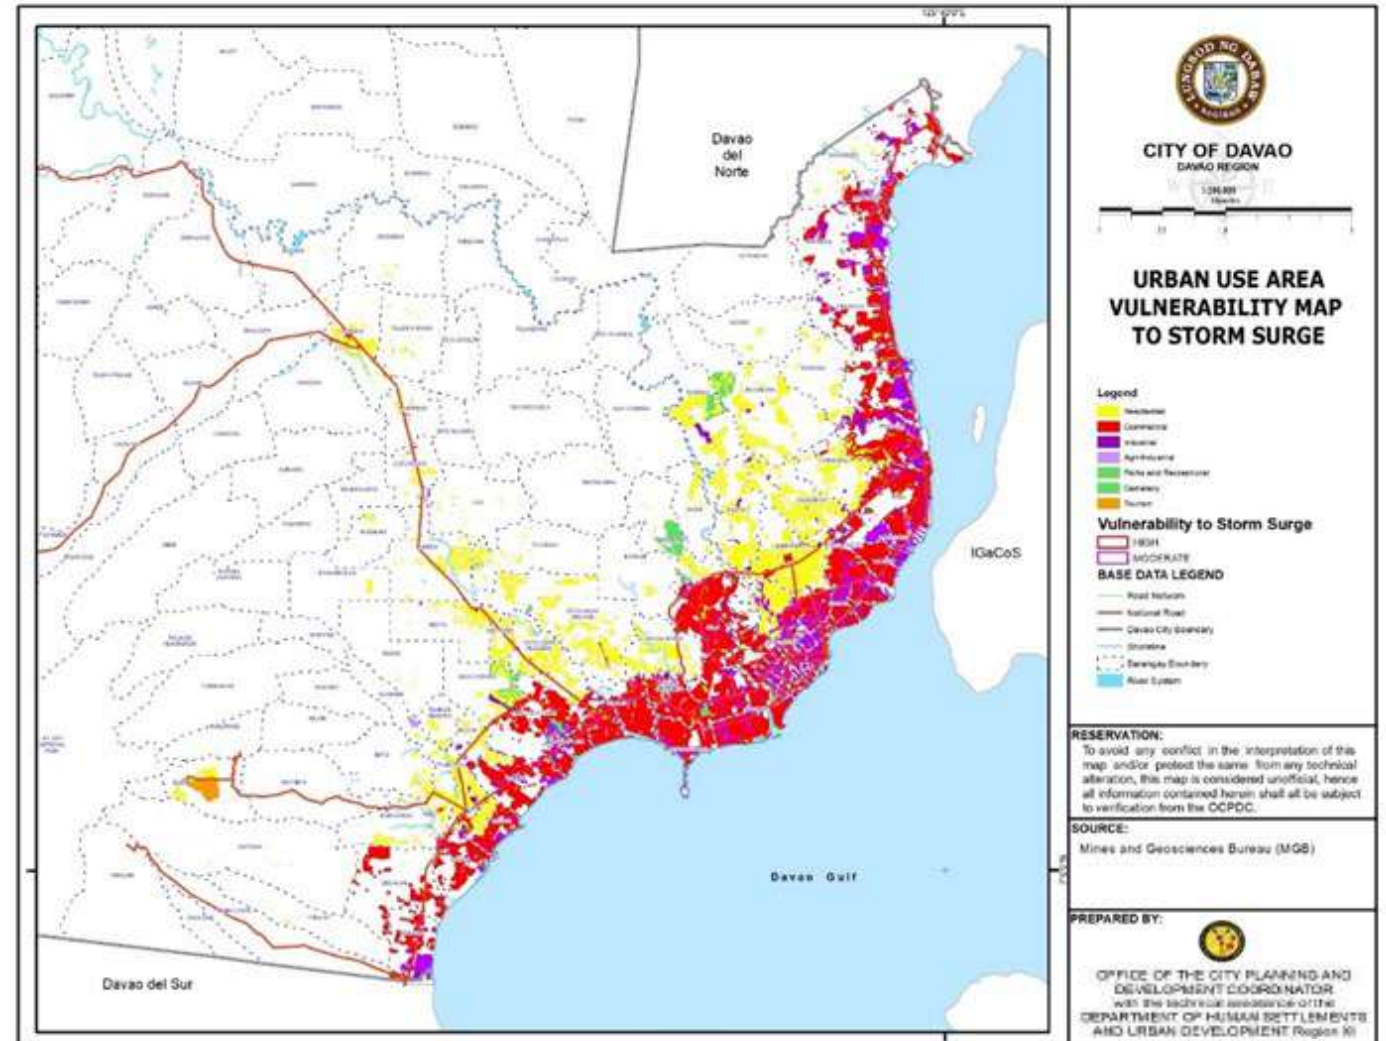

Fault Line- Of the total of 46 barangays susceptible to fault line, four (4) are highly vulnerable. Residential areas are likely to be affected. This is because of the high degree of impact because of “moderate to very high rating” of residential areas in the proportion of buildings with walls with light to salvageable materials and in proportion of buildings in dilapidated/condemned condition. These areas also have “moderate” rating on the “structure employing hazard resistant/adaptation design” and in “no access/area coverage to infrastructure related hazard mitigation measures employing hazard resistant/adaptation’. As to the adaptive capacity, these areas have low adaptive capacity attributed to no insurance coverage and no capacity and willingness to retrofit or conform to new regulations. The imminent danger of strong quakes is posed to incur damage of Php 294,951,425, such could still be prevented by strong implementation of zoning regulations identification of alternative sites and utilization of government resources.

Map 1. 25 Urban Use Area Vulnerability Map to Liquefaction and Active Fault, Davao City

Map 1. 26 Urban Use Area Vulnerability Map to Liquefaction and Active Fault, Davao City

Storm Surge - At least 79 barangays have a high vulnerability impact to storm surge and are mainly residential areas. There are also 153 barangays used as commercial areas which are moderately vulnerable to storm surge.

URBAN USE RISK ESTIMATION FOR FLOOD

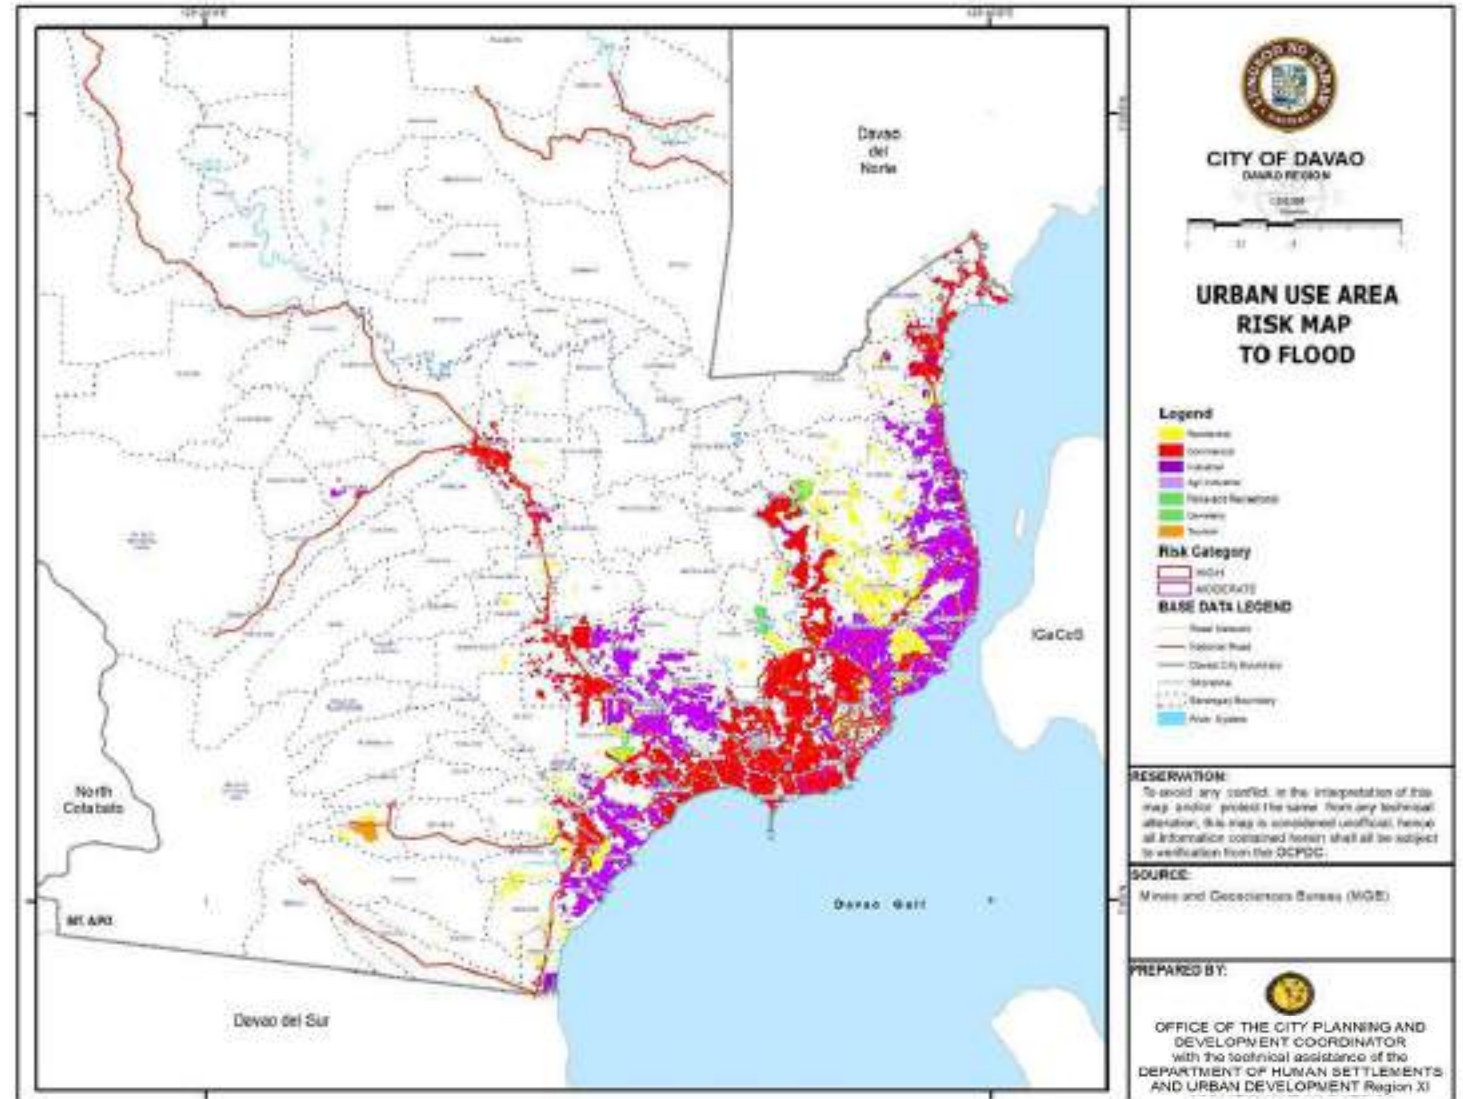

Likelihood of Occurrence- In disaster risk assessment, only hazards with history of occurrence in the city are considered. This assessment was accomplished by analysing the frequency of disasters throughout the years based on the data of the City Social Welfare and Development Office. This frequency of disasters is reflected through the likelihood of occurrence rating, which is measured through the following scores: 6 – frequent, which happens every 1 to 3 years; 5 – moderate, occurs every 3 to 10 years; 4 – occasional, happens every 10 to 30 years; 3 – improbable, every 30-100 years; 2 – rare event, every 100-200 years; and 1- very rare event which happens every 200 years. It can be noted that for the purpose of this study only hazards such as flood and landslide which have history of occurrence in the city is assessed. The other hazards such as storm surge, active fault and liquefaction were not included. A total of 53 barangays which registered the score of six (6), most of which are residential in use followed by industrial, and third as commercial.

At least 36 barangays scored five (5), 52 are rated four (4), and three (3) barangays are rated at 3.

Severity of Consequence Score- Severity of consequence is measured as follows: very high (VH), 4, means >40% non-residential structures are severely damaged or 20% of residential structures are severely damaged; high (H), 3, is when >20 to 40% non-residential based structures area severely damaged or 10 to 20% residential structures are severely damaged; moderate (M), 2, is when 10 to 20% of non-residential structures are severely damaged or 5 to 10% of dwelling units are severely damaged; and low (L), 1, is when production based structures are < 10% or < 5% of dwelling units are severely damaged. For flood, out of the 76 barangays affected by flood in the residential area, 57 barangays are assessed to have the highest severity of consequence when flood-induced damages incur in the area. These identified barangays have a total area of 3,940.11 hectares with a portion of 29.7% as an area wherein has most severe damage to residential structures.

Map 1. 27 Urban Use Area Risk Map to Flood, Davao City

Areas at Risk to Flood- There is a total of 24 barangays which are highly recommended to have hazard mitigation measures in terms of flood. Out of these barangays Ma-a has the highest number of hectares at risk to flood. It has 193 ha of urban spaces are at high risk to flood, 71% is residential area, 14% is commercial, 9% industrial, 3% parks and recreation, and 3% tourism. Aside from Ma-a, Calinan should also be highly considered because 129.64 ha is at high flood risk, 83% is residential area, 15% commercial, 2% industrial, 1% parks and recreation. Barangays Matina-Aplaya, Bucana, 8-A, 19-B, Bunawan, Los Amigos and Bago Gallera are also among the areas with high number of hectares at risk to flood with 87.13 has, 86.72 has, 56.07 has, 45.47 has, 66.74 has, 43.59 has, and .49.64 has of high flood risk areas, respectively.

LANDSLIDE

Likelihood of Occurrence- In considering exposure to hazard, likelihood of occurrence is taken into consideration. This is measured through the following scores: 6 – frequent, which happens every 1 to 3 years; 5 – moderate, occurs every 3 to 10 years; 4 – occasional, happens every 10 to 30 years; 3 – improbable, every 30-100 years; 2 – rare event, every 100-200 years; and 1- very rare event which happens every 200 years.

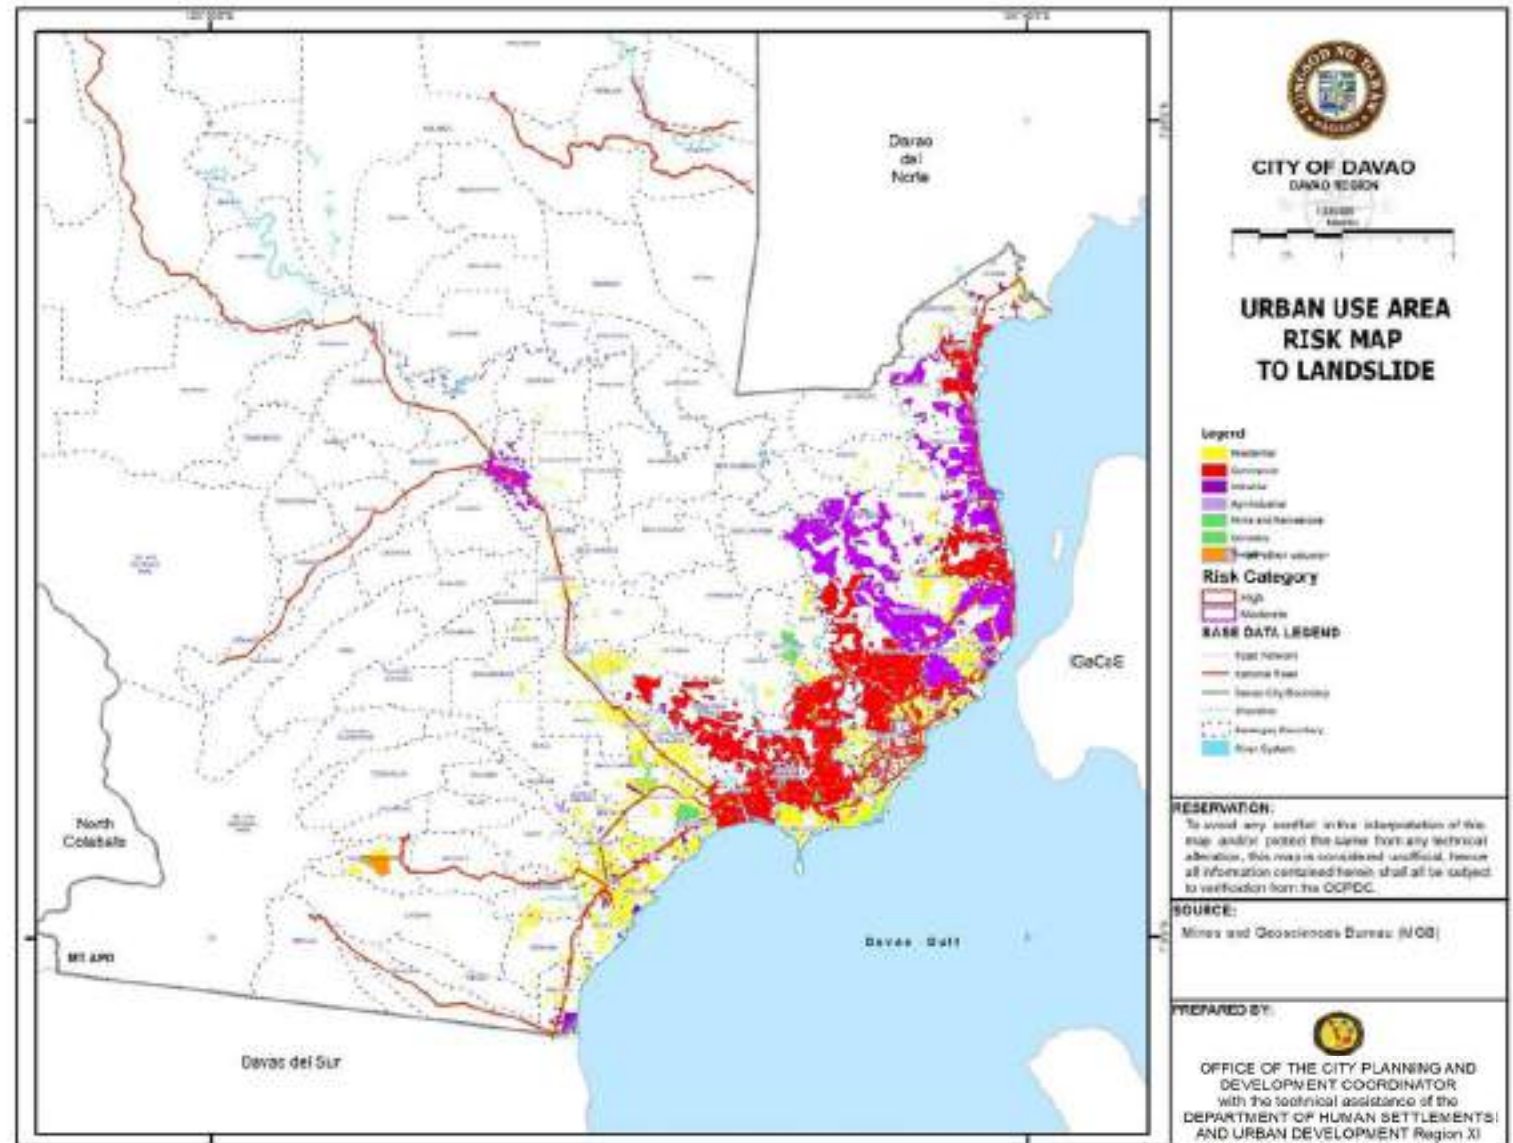

Barangays Tapak, Matina Crossing, and Matina Pangsi are the top three in terms of having the highest likelihood of occurrence of landslide with a score of six (6). For barangay Tapak the exposed area is used as residential while those of barangay Matina Crossing are for industrial, residential, and commercial use; and for barangay Matina Pangsi, the areas are utilized for commercial, parks and recreation, tourism, residential, and industrial use.

Severity of Consequence Score- The severity of consequence is measured as follows: very high (VH), 4, means >40% non-residential structures are severely damaged or 20% of residential structures are severely damaged; high (H), 3, is when >20 to 40% non-residential based structures area severely damaged or 10 to 20% residential structures are severely damaged; moderate (M), 2, is when 10 to 20% of non-residential structures are severely damaged or 5 to 10% of dwelling units are severely damaged; and low (L), 1, is when production based structures are < 10% or < 5% of dwelling units are severely damaged.

The 79 affected barangays in the residential area were found to have an average of 24.2% expected damaged residential structure brought about by landslide which is categorized as a high severity of consequence based from the severity of consequence score matrix (NDCC Memorandum Order No. 4, Series of 1998).

Map 1. 28 Urban Use Area Risk Map to Landslide, Davao City

Areas at Risk to Landslide- Based on the above figure, the 90 exposed barangays to landslide have a high severity of consequence with a moderate likelihood of occurrence to landslide and a low adaptive capacity, thus, concludes that the residential area exposed to landslide is a high risk area. Reflected in the table below are areas with moderate to high landslide risk. Out of these barangays ten (10) are

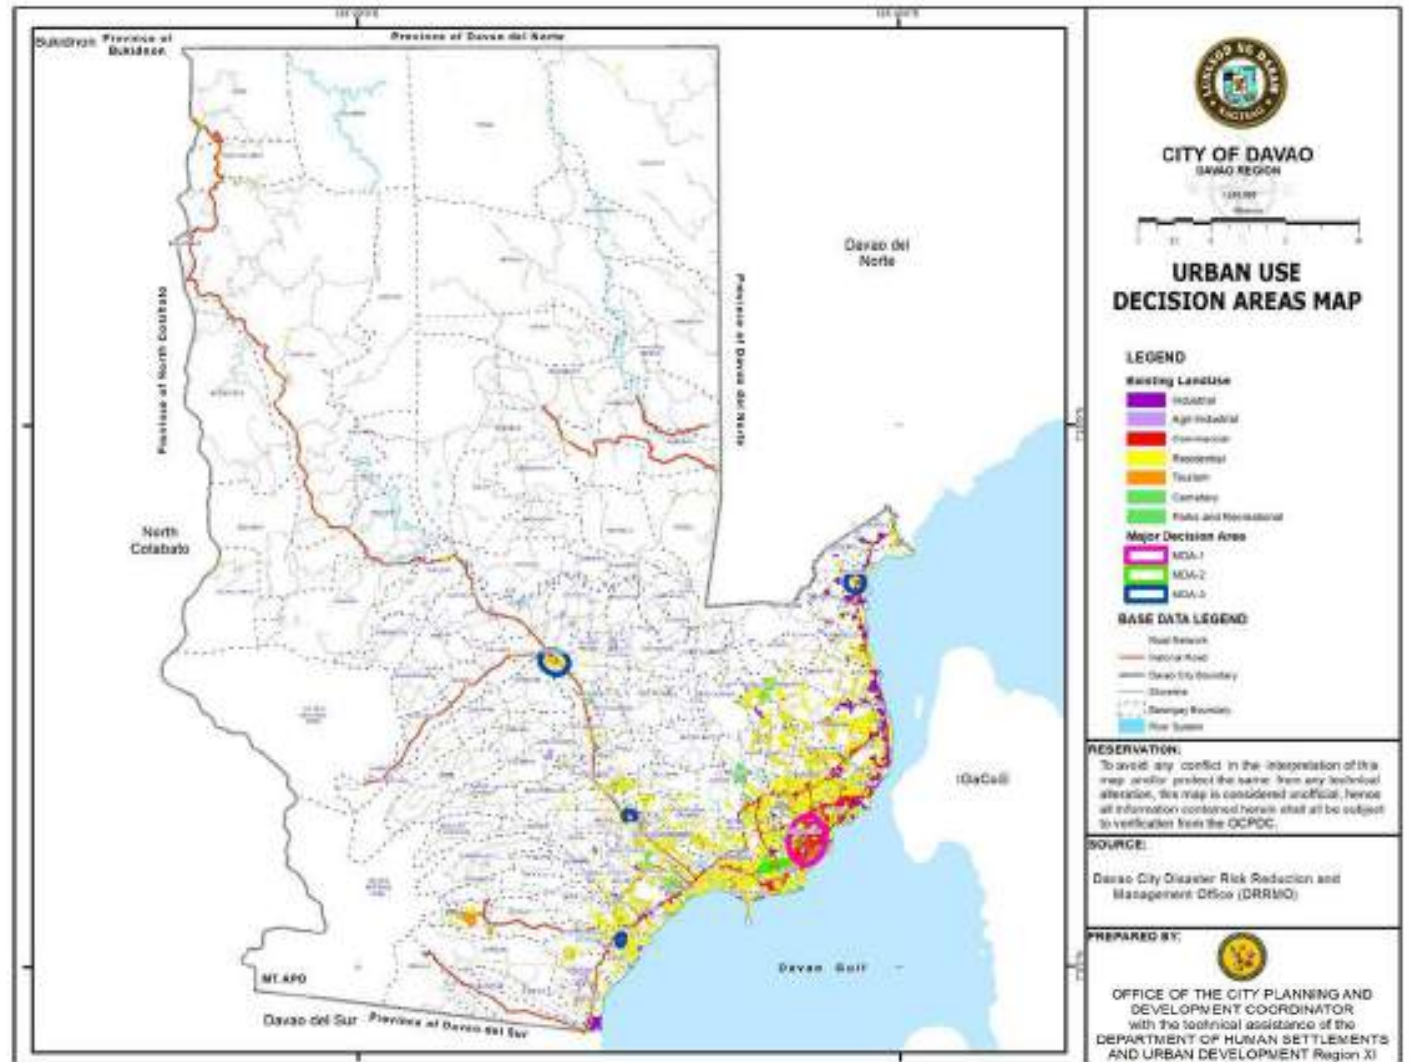

Integrated Major Decision Areas

The Integrated Major Decision Areas, categorized into Major Decision Area-1 (MDA-1), Major Decision Area-2 (MDA-2), and Major Decision Area-3 (MDA-3), summarizes the priority areas for intervention of the local government in terms of policies and projects in the next ten (10) years as a result of the Climate Disaster and Risk Assessment made, based on the five (5) exposed elements: Population, Critical Point Facilities, Lifeline Utilities, Natural Resource-Based Production Area and Urban Use.

After the assessment, Suawan, Matina Crossing, Talomo, Marilog, Tigatto, Ma-a, Matina Pangi, Panacan, Tamugan, Calinan, 19-B, Mintal, Tugbok, Bunawan, Bucana, Matina Aplaya were identified as Integrated Major Decision Areas-1. MDA-1 are the top priority areas for immediate attention, and implementation of risk mitigation projects and programs.

On the other hand, Buhangin, Leon Garcia Sr., 8-A, Los Amigos, Malabog and Salaysay are identified as Integrated Major Decision Areas-2. These barangays are the second highest priority, while barangays 1-A, 2-A, 5-A, 21-C, 22-C, 23-C, 31-D, Centro, Waan, Lasang, Bago Aplaya, Catalunan Pequeño are identified as Integrated Major Decision Areas-3, the third highest in priority for risk and disaster mitigation projects.

Map 1. 29 Urban Use Decision Areas Map, Davao City

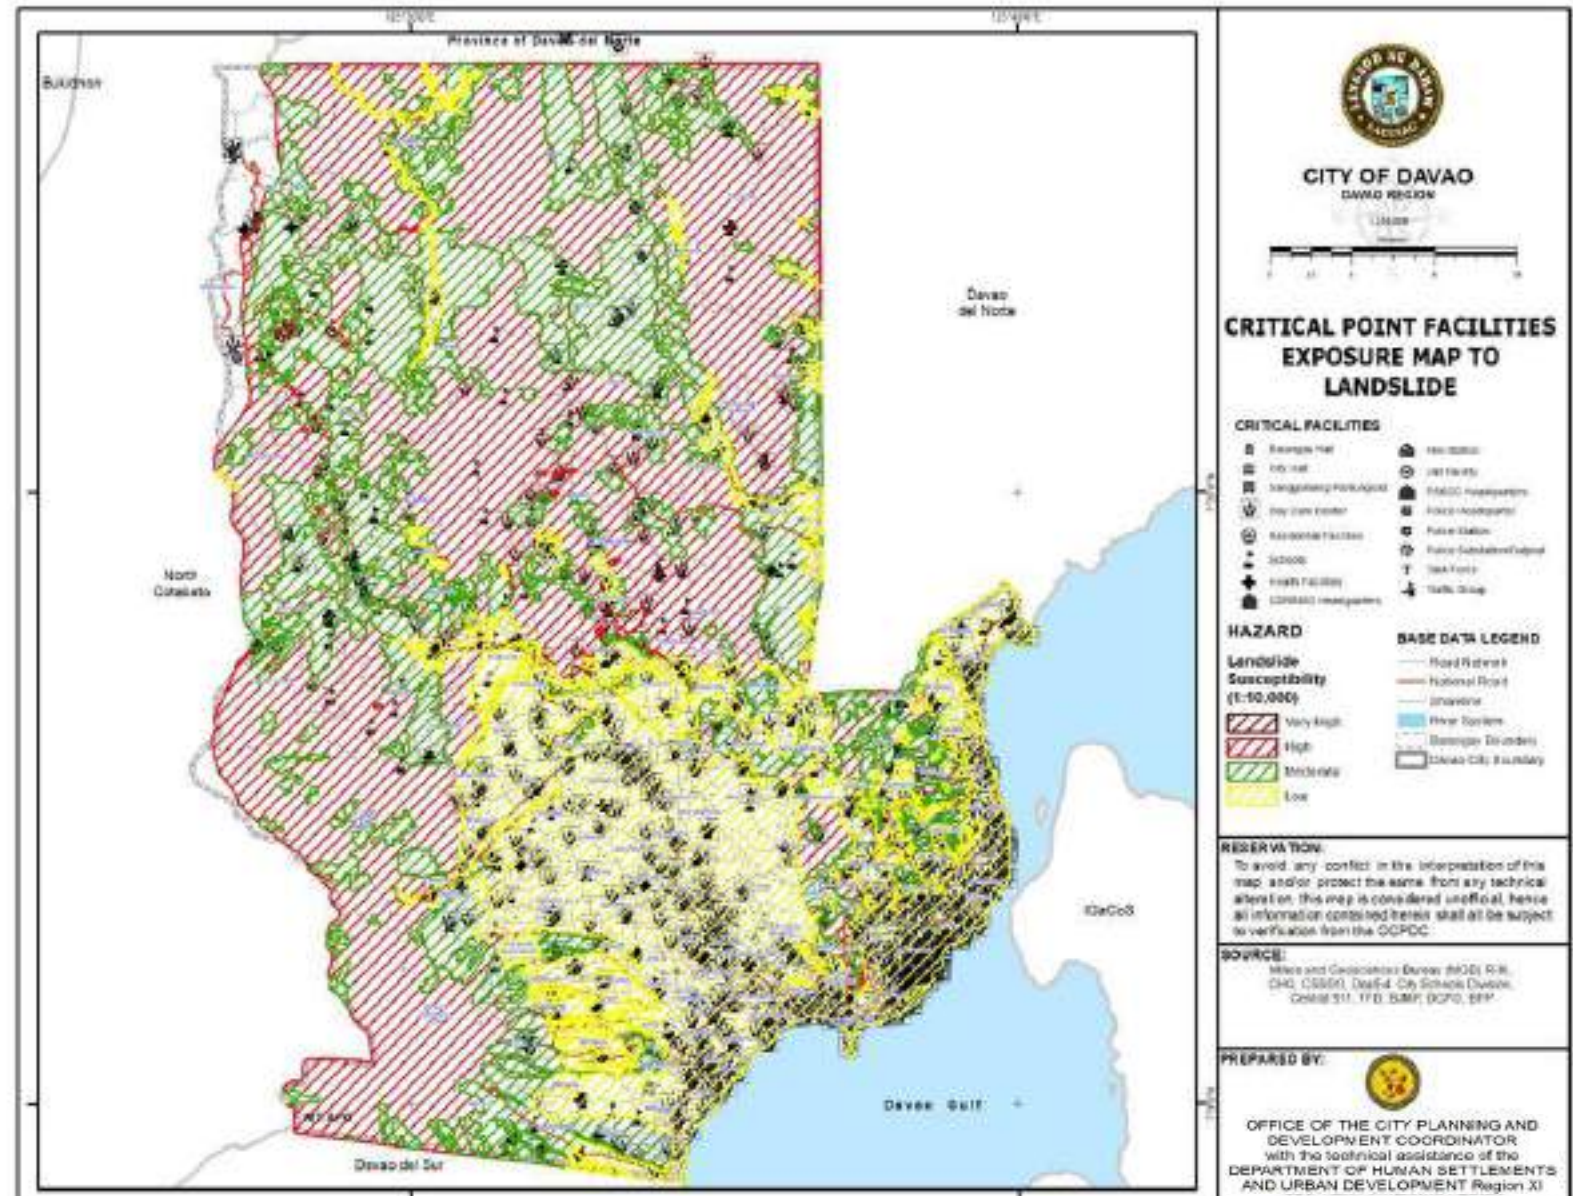

CRITICAL POINT FACILITIES EXPOSURE

Map 1. 31 Critical Point Facilities Exposure Map to Landslide, Davao City

LANDSLIDE

Critical point facilities exposed to landslide total to 358 wherein 214 are not employed with hazard resistant design while 64 are already retrofitted or employed designs that reinforced the design of the structure to increase its adaptive capacity in the occurrence of landslides.

Most of the facilities or 160 are found to be in good condition, 135 facilities need repair, 39 in fair condition, and 20 are in poor condition, thus susceptible to landslides in the areas where the structures are located.

CRITICAL POINT FACILITIES EXPOSURE

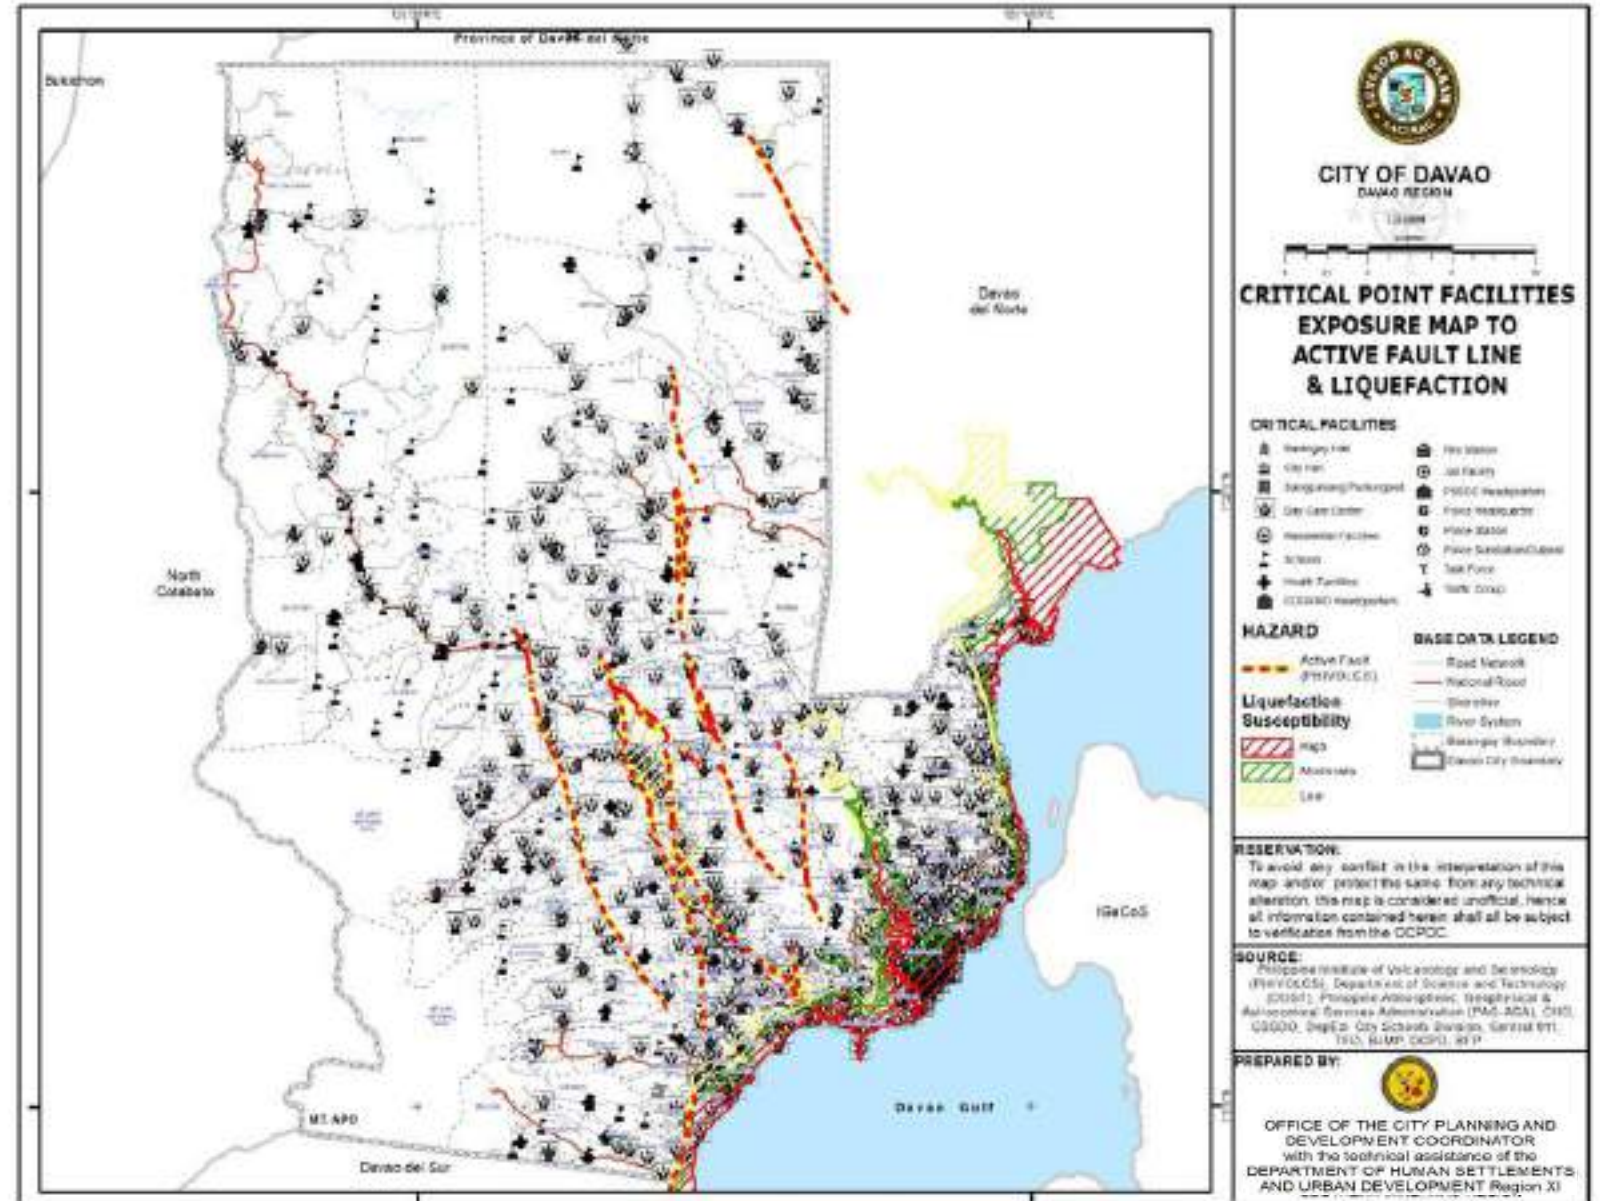

Map 1. 32 Critical Point Facilities Exposure Map to Active Fault and Liquefaction, Davao City

LIQUEFACTION

Total number of critical point facilities susceptible to liquefaction reached 405. Of the total number, three (3) are in critical condition namely: a day care center in Barangay 15-B, Poblacion, another day care center in Matina Aplaya, and a 2-storey fire station in Paciano Bangoy.

A large number of 227 facilities are found to be in good condition while 80 structures need repair, the rest or 67 are in fair condition, and 28 are in poor condition.

There are 293 structures that are not designed employing hazard resistant means, while 112 facilities have been retrofitted or have adopted other alternatives to improve its condition and degree of susceptibility.

CRITICAL POINT FACILITIES EXPOSURE

Map 1. 33 Critical Point Facilities Exposure Map to Storm Surge, Davao City

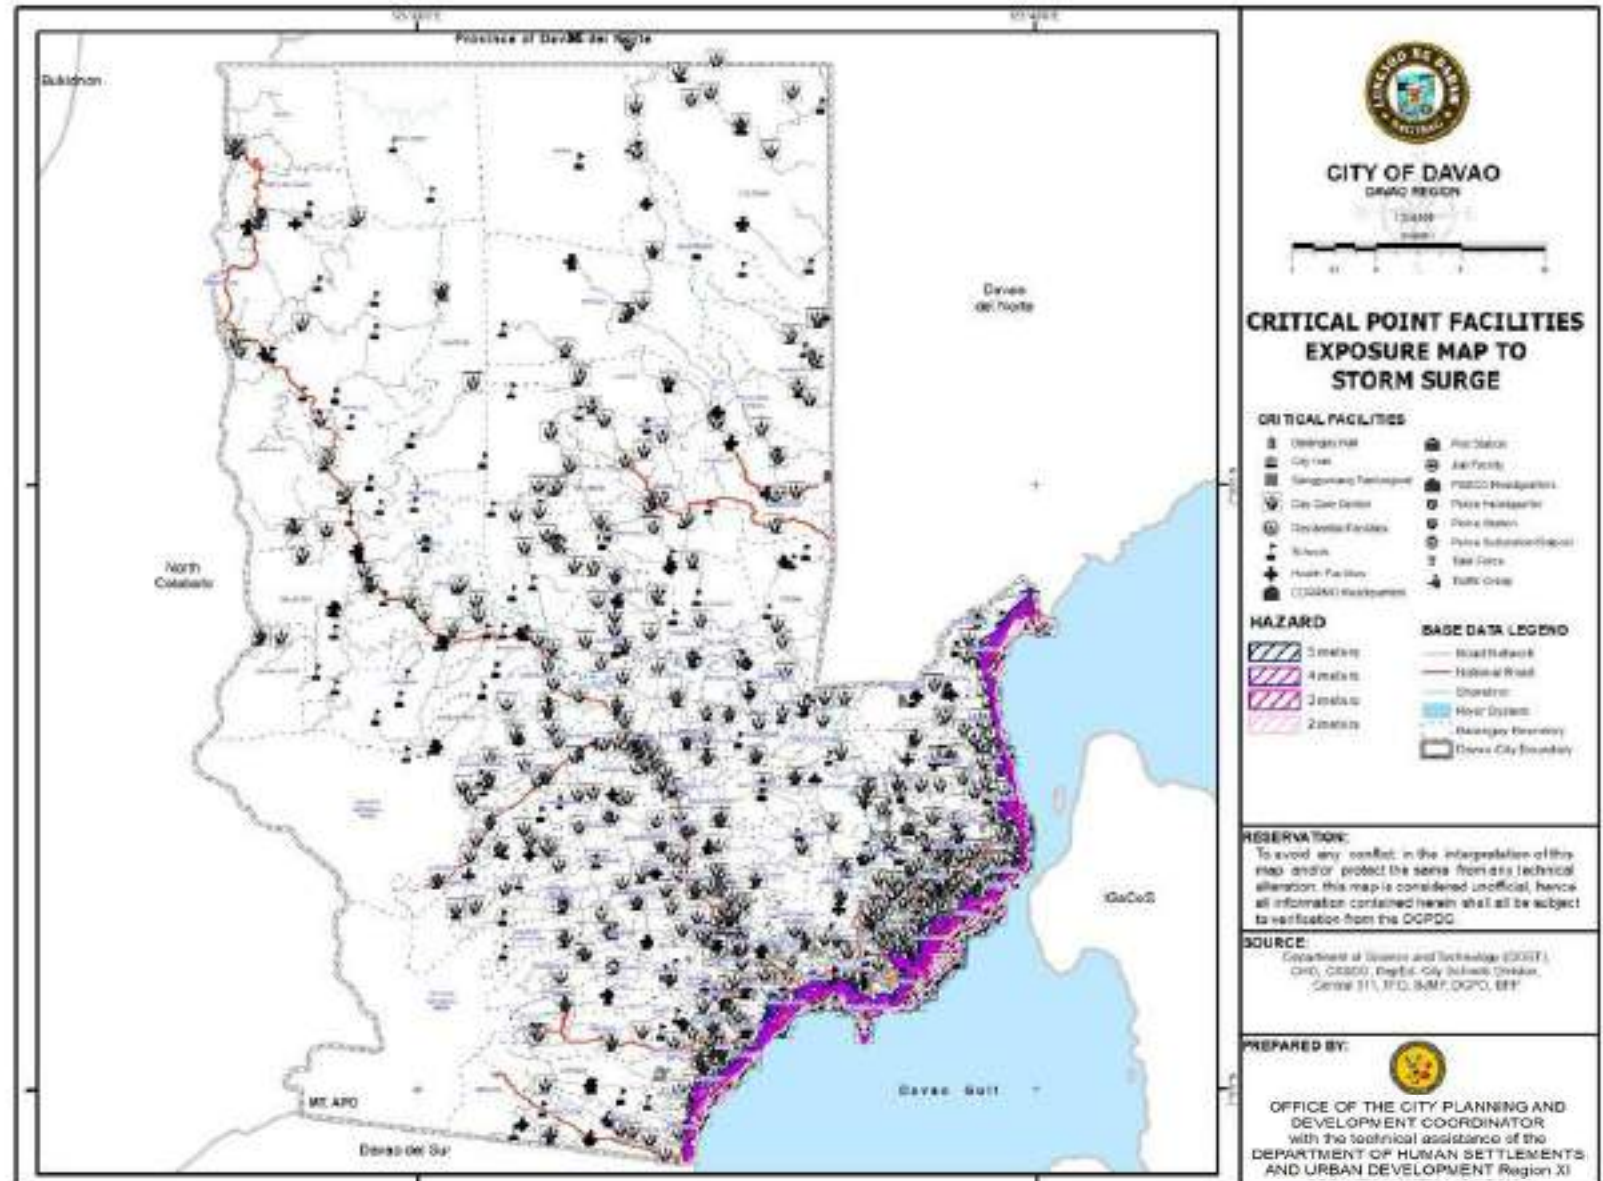

STORM SURGE

There are 310 critical point facilities determined to be exposed to the occurrence of storm surge.

Four (4) facilities are in critical condition, namely: two (2) daycare centers at Barangay 15-B, Poblacion, and Matina Aplaya; and two-storey fire station at Paciano Bangoy and Matina Crossing.

There are 153 facilities determined to be in good condition, while 68 are considered to be in fair condition, 25 in poor condition, and 57 need to be repaired.

There are also 214 structures that are to be reinforced with hazard resistant design while the remaining 96 have already been employed with hazard resistant design.

Adaptive Capacity of Critical Point Facilities

Flood

There are 285 structures that are exposed to flood and of the total number, 143 bear the adaptive capacity of 1 which is considered to have a high adaptive capacity while 139 were given the score of 2 or moderate while three structures received the rating of 3 or low. These critical point facilities with low adaptive capacity are all single storey day care centers located at Barangays 19-B, Lapu-Lapu, and Calinan. These three structures should avail resources from the government for mitigating the impacts of flooding when the same occurs in the area.

Landslide

The number of critical point facilities susceptible to landslide total to 358 where 57 have high adaptive capacity, 267 facilities were determined to have moderate adaptive capacity, and while 33 structures have low adaptive capacity. Of the 33 structures, 32 are day care centers and 1 barangay hall. These structures with low adaptive capacity do not have insurance coverage and no resources to mitigate the effects of landslide. Most of the 33 structures have high degree of impact, which implies fatalities in the event landslides will take place.

Storm Surge

Of the 310 critical point facilities identified to be susceptible to landslide, 184 were given the adaptive capacity of 1, 107 facilities were determined to have moderate of adaptive capacity to take in change in the climate, while there are 19 with low capacity to adopt to impacts of climate change. The 19 structures are barangay halls (3), day care centers (6), elementary schools (8), and secondary schools (2). These structures are not covered by property damage insurance, thus, should consider adopting mitigating measures since these structures were also have a high degree of impact in the occurrence of storm surge in the areas where these are located.

Liquefaction

There are 405 critical point facilities susceptible to liquefaction, 216 have high adaptive capacity, 175 moderate, and 14 were given the score of low. The 14 structures are barangay halls (3), barangay health stations (5), day care centers (3), elementary schools (2), and a secondary school. These structures are not covered by insurance. As to the improvement of the structure so as to increase its adaptive capacity, funds for retrofitting can be sourced from the disaster risk reduction and management fund of the city government.

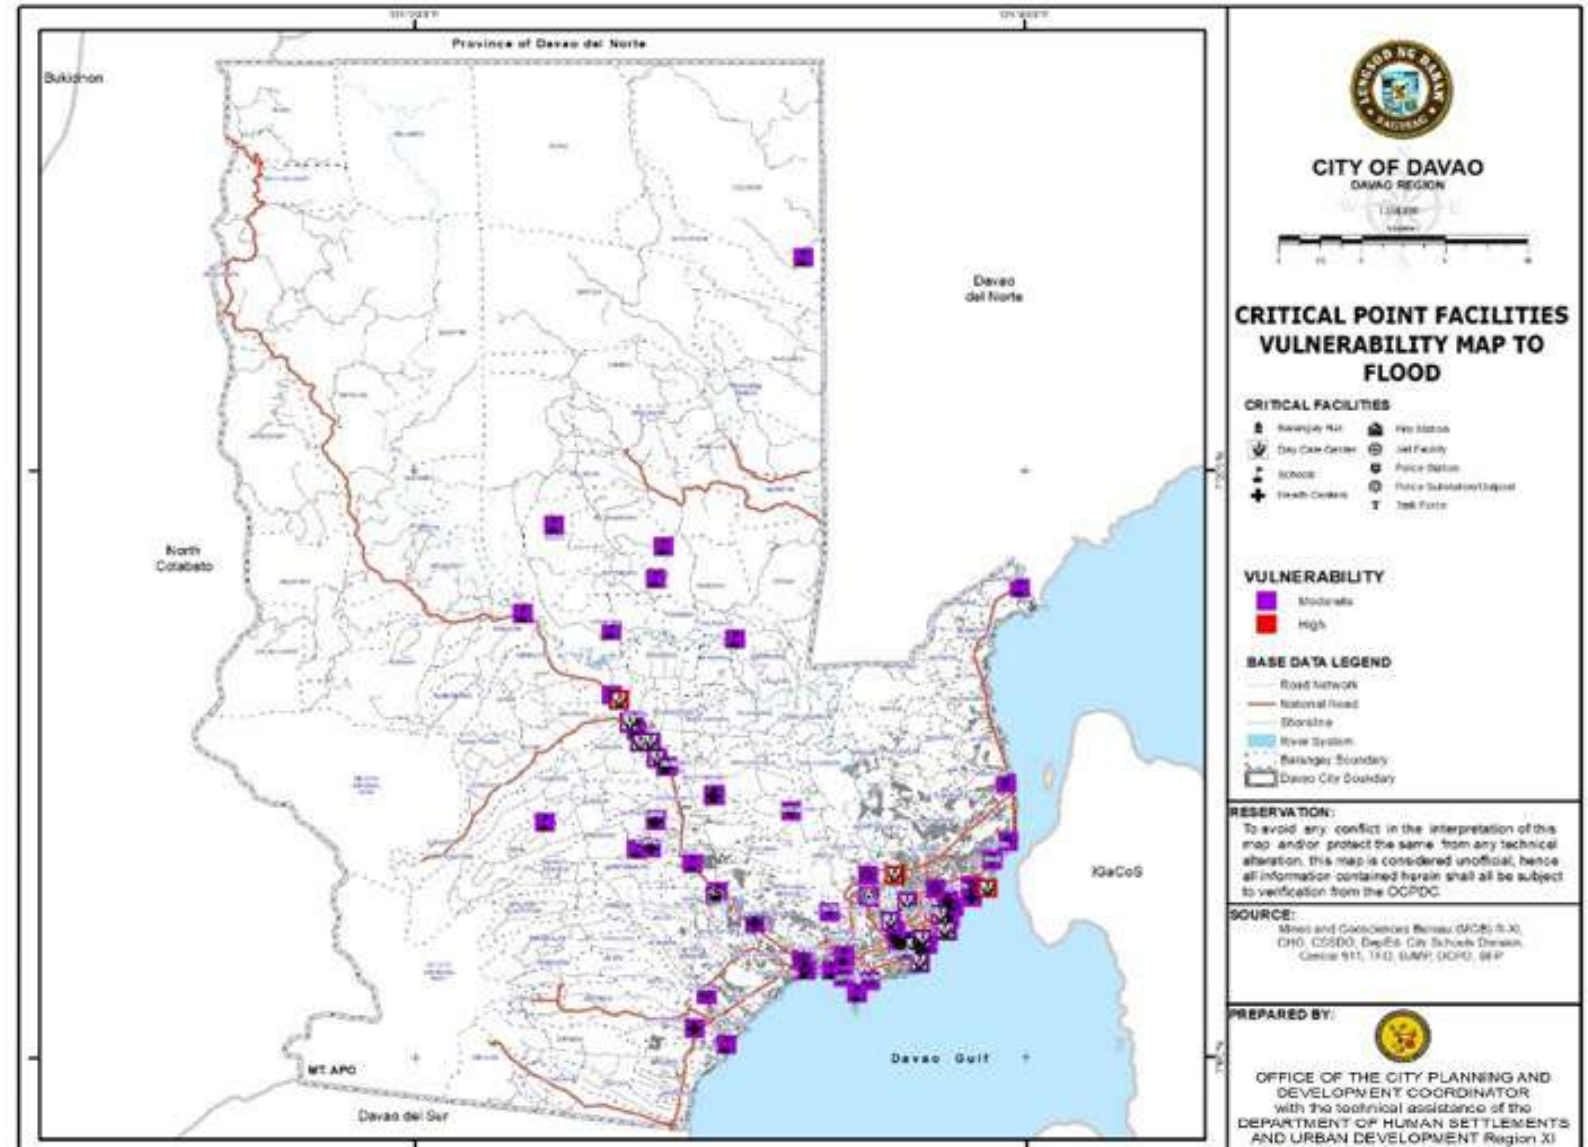

Critical Pont Facilities Vulnerability Index

Map 1. 34 Critical Point Facilities Vulnerability Map to Flood, Davao City

Flood

There are only three facilities under the “high” category which can be interpreted as structures where expected impact of the flooding hazard is high and said structures have low capacity to take in said impacts. The structures are day care centers in Barangay Lapu-Lapu, Calinan, and 19-B.

There are 19 critical point facilities that are considered to belong under the “High” vulnerability category within storm surge impact areas which are barangay halls (3), day care centers (6), elementary schools (8), and secondary schools (2).

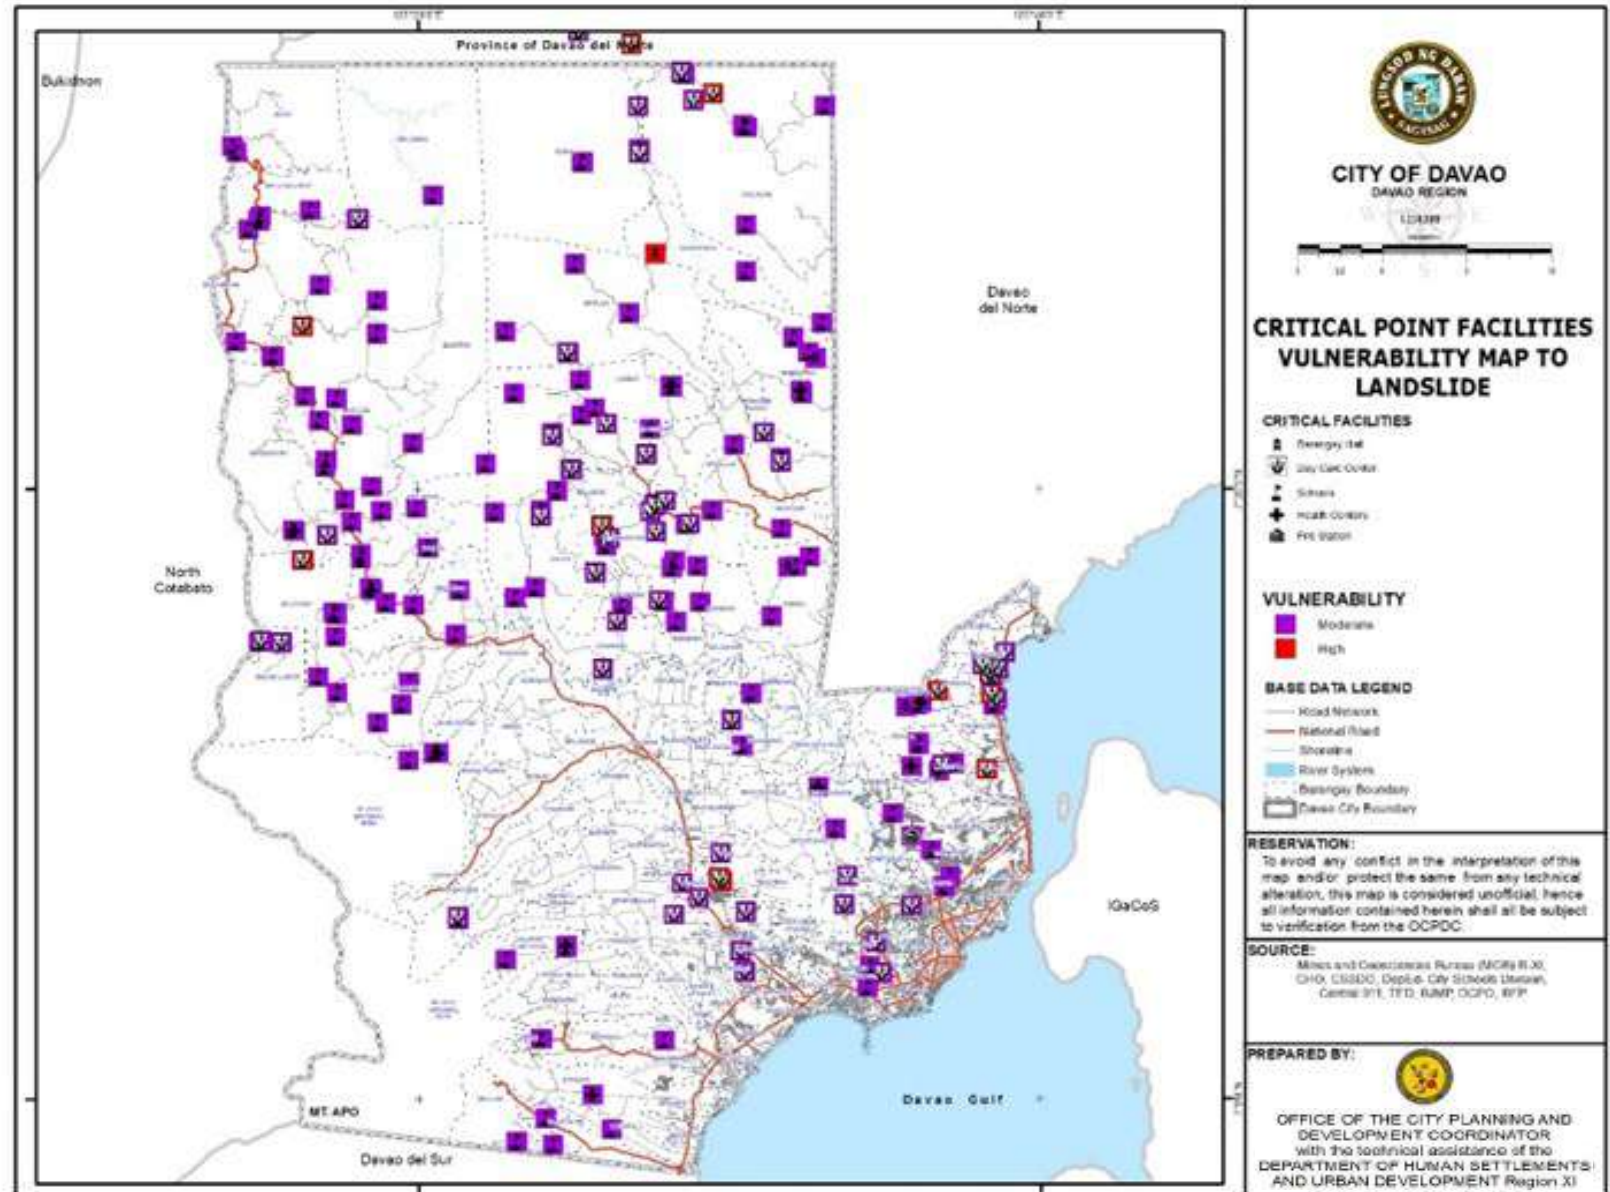

Critical Pont Facilities Vulnerability Index

Landslide

Under the “High” category are 21 critical point facilities wherein 20 are single-storey day care centers and one is a barangay hall.

Map 1. 35 Critical Point Facilities Vulnerability Map to Flood, Davao City

The table below is a summary of the government structures that are exposed to risks including the level of risks and type of facilities:

Facility Type	FLOOD			LANDSLIDE		
	No. of Facilities	Risk Category		No. of Facilities	Risk Category	
		Moderate	High		Moderate	High
Barangay Hall	3	1	2	2	1	1
Barangay Health Station	13	10	3	13	10	3
Day Care Center	62	61	1	76	62	14
Elementary School	13	6	7	111	56	55
Police Outpost	5	0	5			
Police Sub-Station	7	0	7			
Secondary School	6	3	3	22	11	11
SIR Fire Station	1	1	0			

Of the total number of police sub-stations, two have very high risk exposure to flood belonging to Barangay Tomas Monteverde and Ubalde. Both structures are within urban areas and within Agdao District.

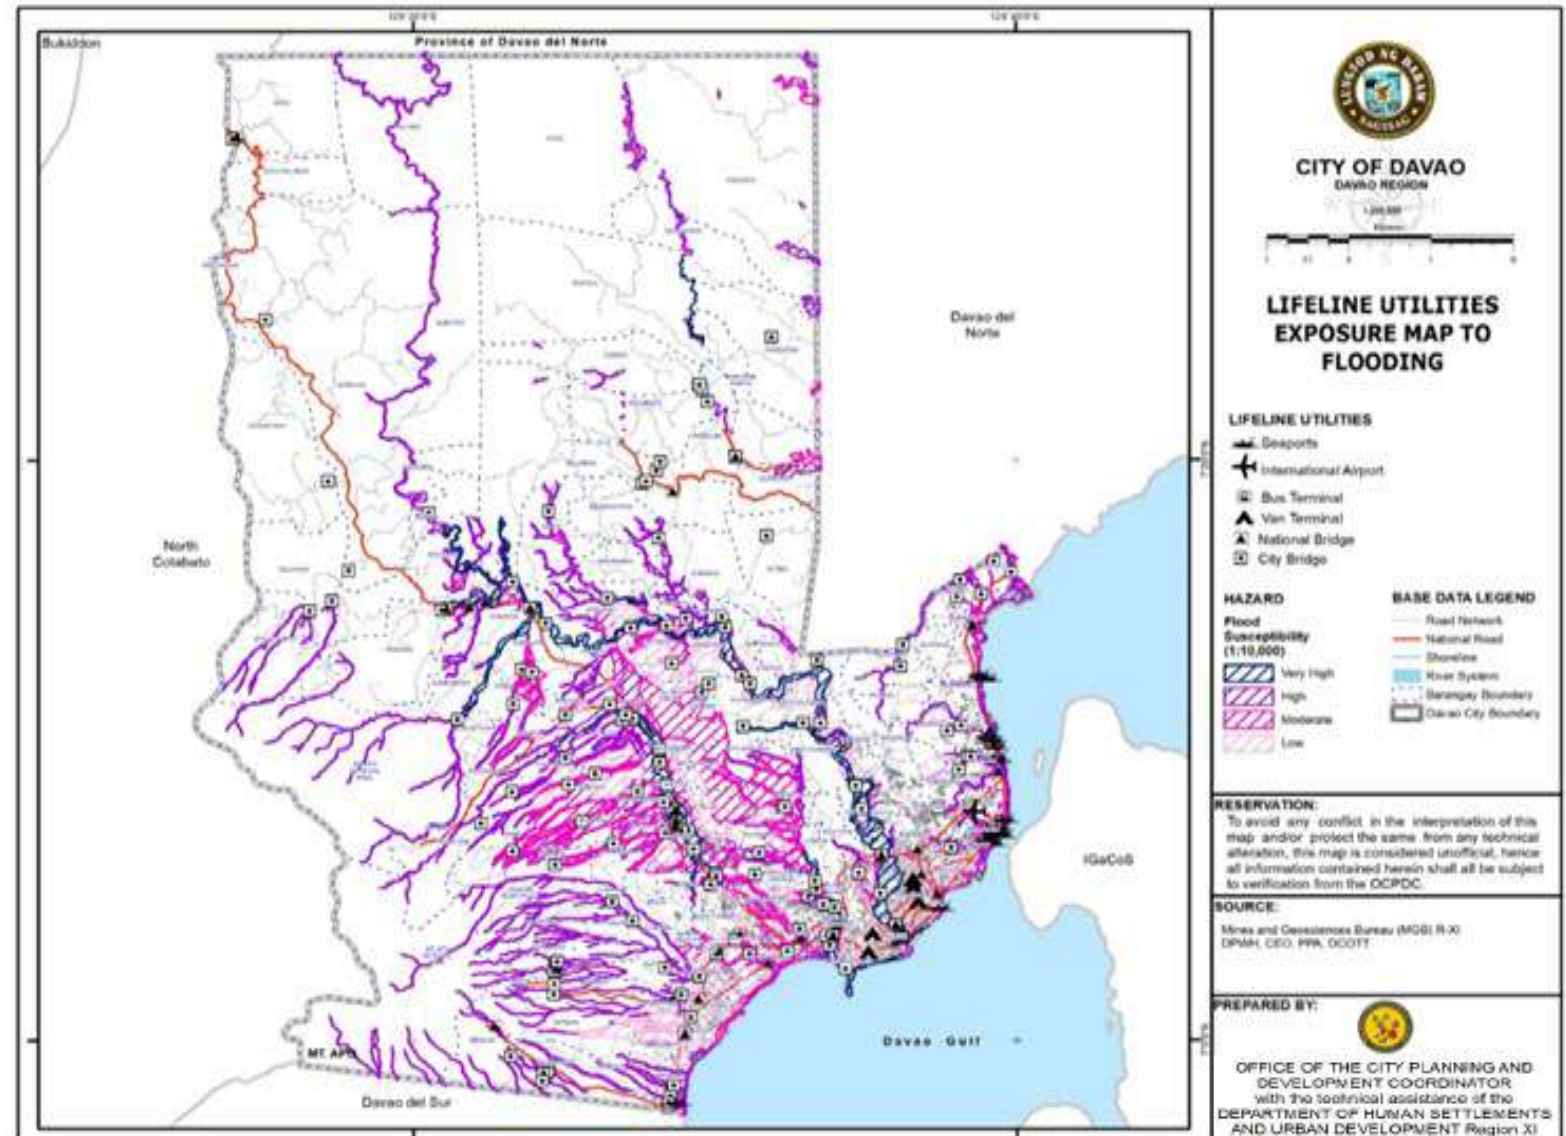

Lifeline Utilities Exposure to Hazards

Roads - A total of 15 portions are highly susceptible to flood. The Davao Bukidnon Road has the longest road network exposed at 15.67 meters. It is followed by Fatima- Malabog Road with 8.8631 meters exposed and Carlos P. Garcia Highway with 4.9353 meters.

Bridges - A total of 26 bridges are located in a high flood susceptibility area, this could be attributed to the location of the bridges in major rivers. The top three (3) bridges which assessed to be highly susceptible to flood are Bolton Bridge 2 with 185.30 meters exposed length, Bolton Bridge 1 with 185.30 meters exposed length, and Davao River Bridge with 141.11 meters exposed length.

Power Substations -A total of three (3) substations are located in high flood susceptibility area. These are: Calinan Substation, Tugbok Substation and Matina Substation. These newly upgraded substations were made of concrete and steel. These are designed to withstand typhoon, earthquake, fire, flood, oil spill, and sabotage and terrorism. As for its adaptive capacity, the substations have risk insurance.

Map 1. 39 Lifeline Utilities Exposure Map to Flooding, Davao City

Lifeline Utilities Exposure to Hazards

Water

Level I- A total of three (3) spring sources in Tibungco, two (2) spring sources in Panacan and Binugao, and one (1) well from Lizada are highly susceptible to flood.

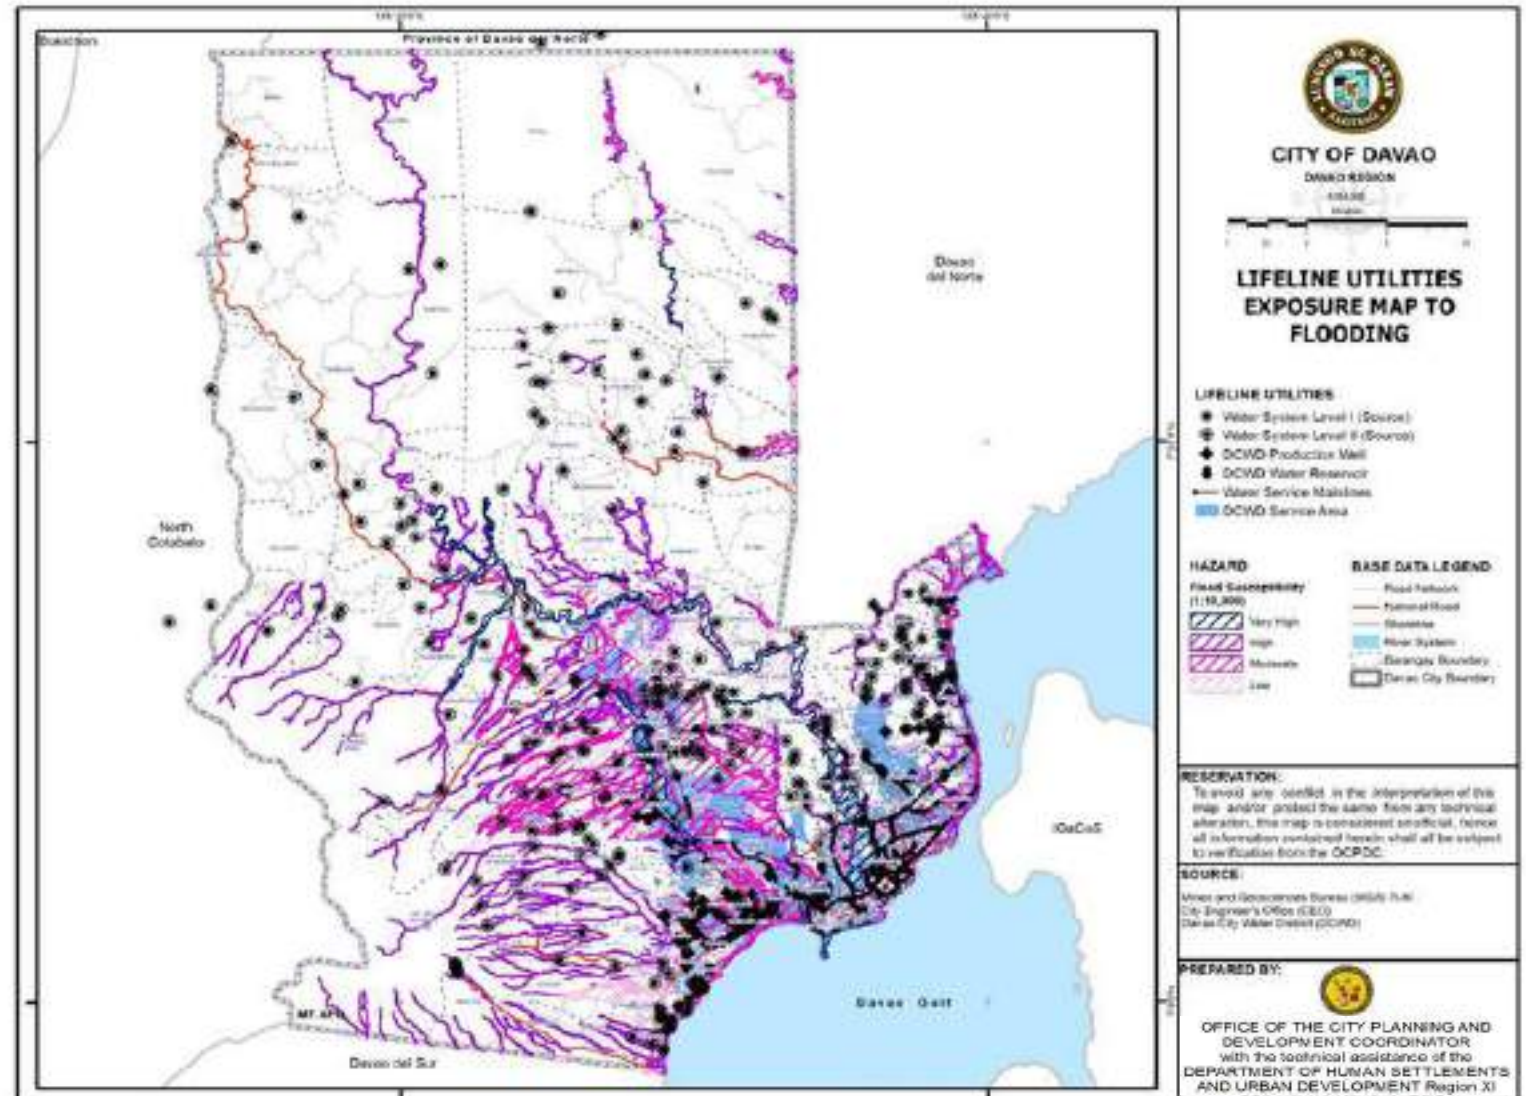

Level II Water System-A total of eleven (11) spring sources and six (6) deep wells found in Binugao, Sirawan, Sibulan, Mt. Apo National Park, Tungkalan, Daliaon Plantation, Subasta, Waan, Cawayan, Baguio, Malagos, Salaysay are highly susceptible to flood.

Level III- Out of 205,952.31 meters of main line pipes, 6,624.29 meters are susceptible to high flood. The longest pipeline is in Ma-a with 1,153.29 meters, followed by 629.46 meters located in Barangay Talomo, and then by 644.79 meters located in Barangay Ma-a.

DCWD Production Wells

DCWD has a total of 66 wells susceptible to flood, out of these, six (6) vertical turbine wells are highly susceptible to flood. These wells are found in Kilometer 7, Talomo Sump Bangkal, Barangay Talomo; Davao-Cotabato Road, near Bago Bridge Brgy. Bago Aplaya; Catotal Subdivision near Block 22, Brgy. Bago Aplaya; Mangahan Bridge, Alambre, Toril; Tugbok Quarry, Along Davao Bukidnon Road, Brgy. Tugbok; and Los Amigos.

Map 1. 40 Lifeline Utilities Exposure Map to Flooding, Davao City

Lifeline Utilities Exposure to Hazards

Cell sites

Davao City has a total of 129 cell sites susceptible to flood. Out of the total number, four (4) cell sites are highly vulnerable to flood. These are located in Mc Arthur Highway, Brgy. 74-A, Matina Crossing; Magno Property, No. 64 V. Mapa St.; Brgy. 11-B, #88 Maya St.; Brgy. 76-A, Ecoland, Brgy. Bucana. These cell sites occupy an average of 300 square meters each, with replacement cost ranging from ₱12-P15 million. These cell sites are also made of steel and concrete. Hazard resistant design is also employed for each cell site. Moreover, all of the cell sites have no insurance coverage and available government resources.

Adaptive Capacity of Lifeline Utilities for Flood

Roads-The 2nd Avenue, a minor road supplementary to major thoroughfares without any insurance fund for rehabilitation has the lowest adaptive capacity. Carlos P Garcia Highway Davao, Bukidnon Road, and Davao-Agusan Highway have moderate adaptive capacity. Moderate adaptive capacity means that addressing the impacts will require significant cost but it is still within the capacity of the system to adapt to potential impacts. It can accommodate within its resources, the cost for adapting and mitigating impacts.

Bridges- Davao River Bridge, Pangsi Bridge, Suawan Bridge, Tamugan Bridge, Angalan Bridge III, Angalan Bridge IV, Angalan Bridge VI, Bato Bridge, Bolton Bridge 2, Generoso Bridge I, Libby Bridge, Lipadas Bridge I, Lipadas Bridge II, Pagan Grande, Pagan Pequeño, Piedad Bridge, and Talomo Bridge I have moderate adaptive capacity. All existing bridges do not have damage insurance coverage addressing damages are mostly done thru repairs/retrofitting using either national government fund resources or those funded by regional line agencies.

Power Substations- Based on the assessment all power substations have high adaptive capacity, meaning the system is able to accommodate changes in climate, there are adaptation measures to address the impacts.

Level I Water System- Deep wells located in Talomo River, Ula, and Riverside have high adaptive capacity, while spring sources found in Bunawan, Tibungco, Panacan, Daliao, Lizada, Sirawan and Binugao have moderate adaptive capacity.

Level II Water System- Deep wells found in Sirawan, Marapangi, Daliaon Plantation, Waan and Tigatto have moderate adaptive capacity.

Level III Water System- All mainline pipes have high adaptive capacity. According to DCWD, their office has the team to check and monitor the pipes.

DCWD Production Wells -DCWD wells have high adaptive capacity. The wells are made with flood resilient materials. Monitoring stations built along with each well are also made of concrete and were built higher to withstand flood.

Cell Sites -Built with steel and concrete materials, all cell sites have high adaptive capacity for flooding. These cell sites are placed on top of hills or buildings which makes it less susceptible to flood occurrence.

Lifeline Utilities Adaptive Capacity to Landslide

Roads- Portions of Inawayan-Baracatan Road, Mabuhay-Pañalum-Paquibato Road, and Eden-Tagurano Road have low adaptive capacity. The length exposed for each road network are 5.2520 meters, 1.894 meters, and 0.3792 meters, respectively.

Bridges- Baracatan Bridge, Crossing Malabog Bridge, and Tagurano Bridge have moderate adaptive capacity. This means that addressing the impacts will require significant cost but it is still within the capacity of the system to adapt to potential impacts. It can accommodate within its resources the cost for adapting and mitigating impacts.

Power Substations- Tibungco Substation which occupies 2,326 square meters costing up to P118 million has high adaptive capacity as it has all industrial risk insurance and comprehensive general liability.

Level I Water Supply- Seven spring sources found in Bunawan, Cabantian and Daliao have low adaptive capacity due to the fact that spring sources do not have hazard resistance to landslide.

Level II Water Supply- Spring sources and wells found in Acacia, Bantol, Callawa, Gatungan, Gumalang, Gumitan, Lampianoao, Lumiad, Magsaysay, Magtuod, Manabog, Malamba, Mapula, Marilog, Megkawayan, Mt. Apo National Park, Muding, New Carmen Pañalum, Pandaitan, Paquibato, Paradise Embac, Salapawan, Salysay, Saloy, Sibulan, Sirawan, Suawan, Talandang, Tambobong, Tapak, Tibungco and Tungkalan, have low adaptive capacity for landslide.

Level III Water Supply- A total of 52 mainline pipes moderately and highly susceptible to landslide are located in barangays 19-B, Buhangin, Cabantian, Catalunan Grande, Langub, Ma-a, Magtuod, Matina Crossing, Matina Pang, Panacan, and Talomo have high adaptive capacity.

DCWD Productions Wells- Four (4) wells found in Barangay Indangan, Panacan and Tibungco have high adaptive capacity.

Cell Sites- As for cell site towers, 22 cell site towers found in Talomo, Poblacion, Tibungco have high adaptive capacity.

Lifeline Utilities Adaptive Capacity to Liquefaction

Roads- Agdao Flyover, Bonifacio Rotonda, C. P Garcia Highway, Claro M. Recto, Dacudao Avenue, Davao Bukidnon Road, Davao Agusan Highway, Don Julian Rodriguez Avenue (Ma-a), Jose P. Laurel, Leon Garcia St., McArthur Highway, Quezon Boulevard, Quimpo Boulevard, Quirino Avenue, Rafael Castillo St., Ramon Magsaysay Avenue, Sta. Ana Avenue, and Davao Agusan Highway have moderate adaptive capacity.

Bridges-Agdao Flyover, Panacan Bridge, Pangi Bridge have moderate adaptive capacity.

Power Substations- 12 substations, all have high adaptive capacity, while these substations are not covered by any available government resources, internally, Davao Light and Power Co. has ensured that these stations be covered with industrial all risk Insurance and comprehensive general liability.

Level I Water System- A total of 90 spring sources moderately and highly susceptible to liquefaction are located in Binugao, Bunawan, Cabantian, Daliao, Gatungan, Ilang, Lizada, Lubogan, Mahayag, Mandug, Mudiang, Panacan, Riverside, San Isidro, Sirawan, Talandang, Talomo River, Tibungco, Ula, and Wangan

Level II Water System- Wells found in Binugao, Sirawan, and Waan all have high adaptive capacity. There is no insurance coverage for each but there is one month warranty if the water pump is installed by the supplier. Government resources are also available subject to proposal.

Level III Water System- A total of 433 mainlines located in Talomo, Buhangin, Agdao, Poblacion have a moderate adaptive capacity. These DCWD mainlines do not have insurance coverage but the DCWD has a reserve fund for the maintenance and repair.

DCWD Wells- All 14 wells moderately and highly susceptible to liquefaction have high adaptive capacity. While there wells do not have insurance coverage, the DCWD has a reserve fund for the rehabilitation and maintenance of the wells.

Cell sites- A total of 26 cellsites have moderate adaptive capacity, while 143 have high adaptive capacity. These cell sites are found in Toril, Talomo, Agdao, Bunawan districts.

Lifeline Utilities Adaptive Capacity to Active Fault

Roads -All roads highly and moderately susceptible to earthquake have moderate adaptive capacity. These roads have local fund for rehabilitation repair and improvement and quick response fund for its government resources.

Bridges-All bridges which are exposed to earthquake have moderate adaptive capacity.

Level II Water Supply System- A well in Manambulan has low adaptive capacity.

Level III Water Supply System- All mainline pipes have moderate adaptive capacity. It has DCWD fund for repair and rehabilitation.

Lifeline Utilities Adaptive Capacity to Storm Surge

Roads- C.P Garcia Highway, Dacudao Avenue, Davao-Agusan Highway, Florentino Torres St., J.P. Cabaguio, J.P Laurel, Libby Road, McArthur Highway, Old Airport, Pichon St., Quimpo Boulevard, Quimpo Avenue, and McArthur Highway have low adaptive capacity. These road networks have no insurance coverage and depends on Quick Response Fund.

Bridges-All bridges susceptible to storm surge have high adaptive capacity.

Power Substations- All substations have high adaptive capacity, with corresponding industrial all risk insurance and comprehensive general liability.

Level I Sources- All spring sources susceptible to storm surge have a low adaptive capacity.

Level II- All wells which are susceptible to storm surge have moderate adaptive capacity.

Level III- For main line pipes exposed to storm surge, 529.87 meters of pipeline found in Dumoy, 815.86 meters of pipes found in Bago Aplaya, 180.4 meters of pipes found in Ilang, and 292.51 mainline pipes found Talomo have moderate adaptive capacity.

DCWD Wells- All of the DCWD wells have high adaptive capacity. The mainline pipes do not have insurance coverage but has DCWD fund for repairs and for improvement.

Cell Sites- Two (2) cell sites in Toril, two (2) cell sites in Bunawan and one (1) cell site in Lasang have moderate adaptive capacity while the rest of the cell sites susceptible to storm surge have high adaptive capacity.

Lifeline Utilities Vulnerability to Flood

A total of 12 road networks measuring a total of 37 kms are identified to be highly vulnerable to flooding.

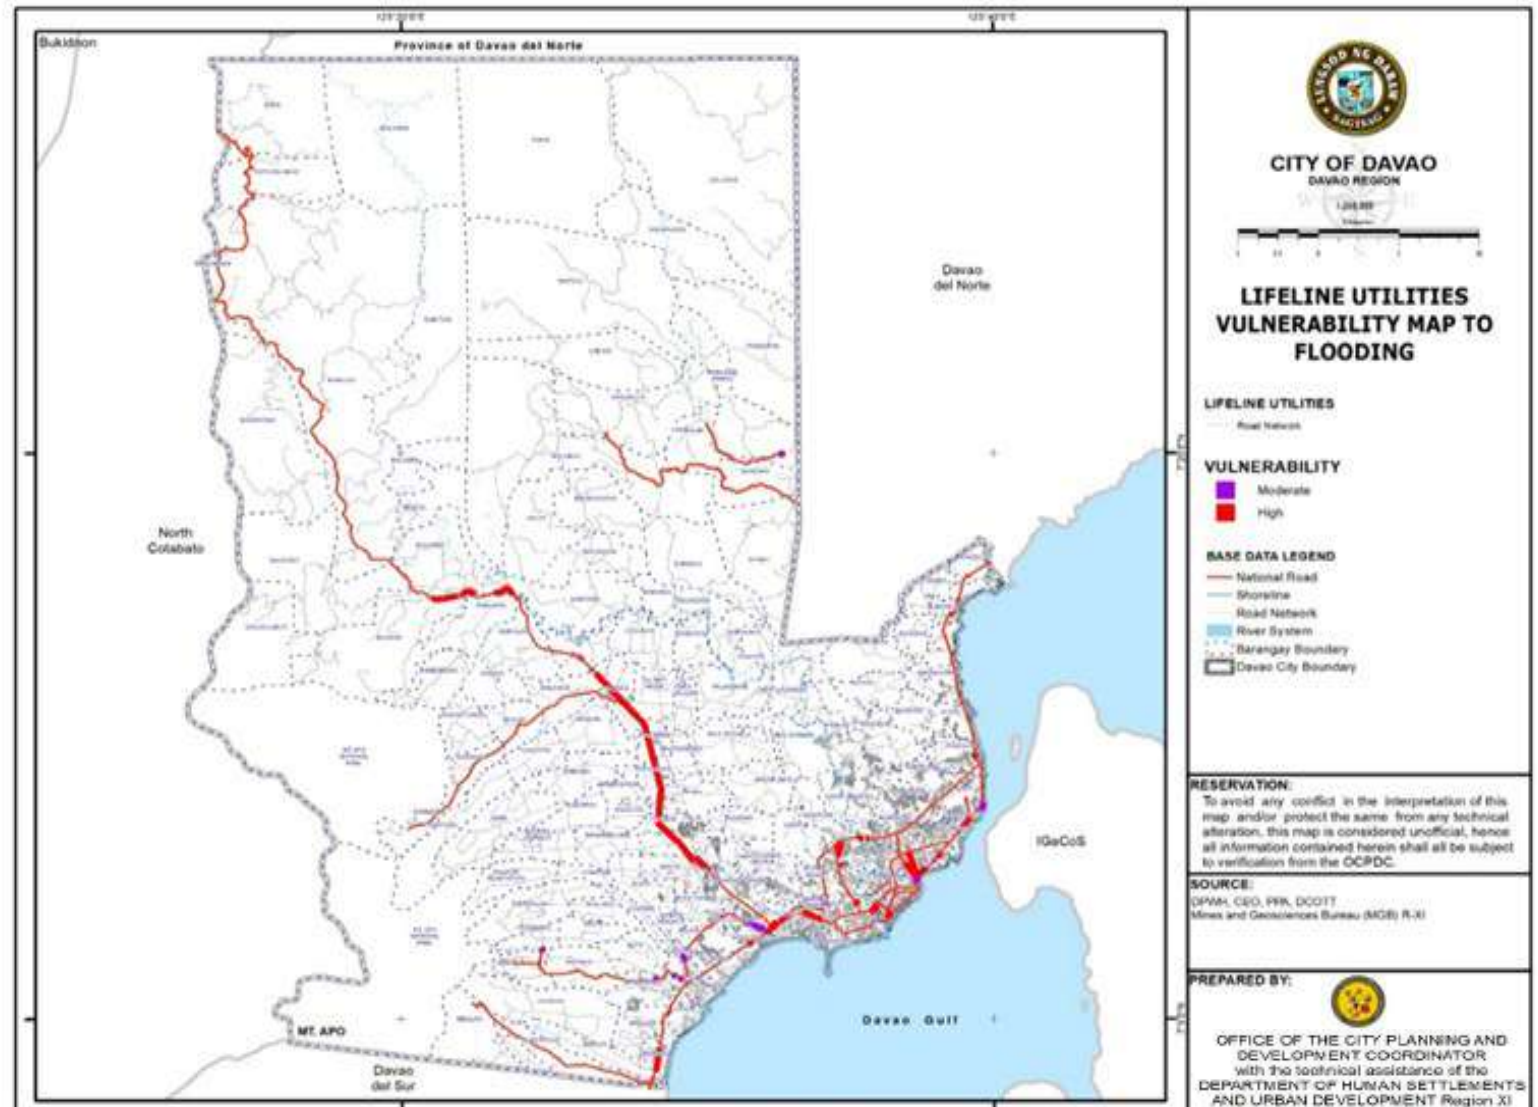

Davao River Bridge, Tamugan Bridge and Pangi Bridge are highly vulnerable to flood.

Level I Water System- Based on the assessment, 31 spring sources were identified to be moderately vulnerable to flood.

Level II Water System- A total of eight Level II Water System are moderately vulnerable to flood.

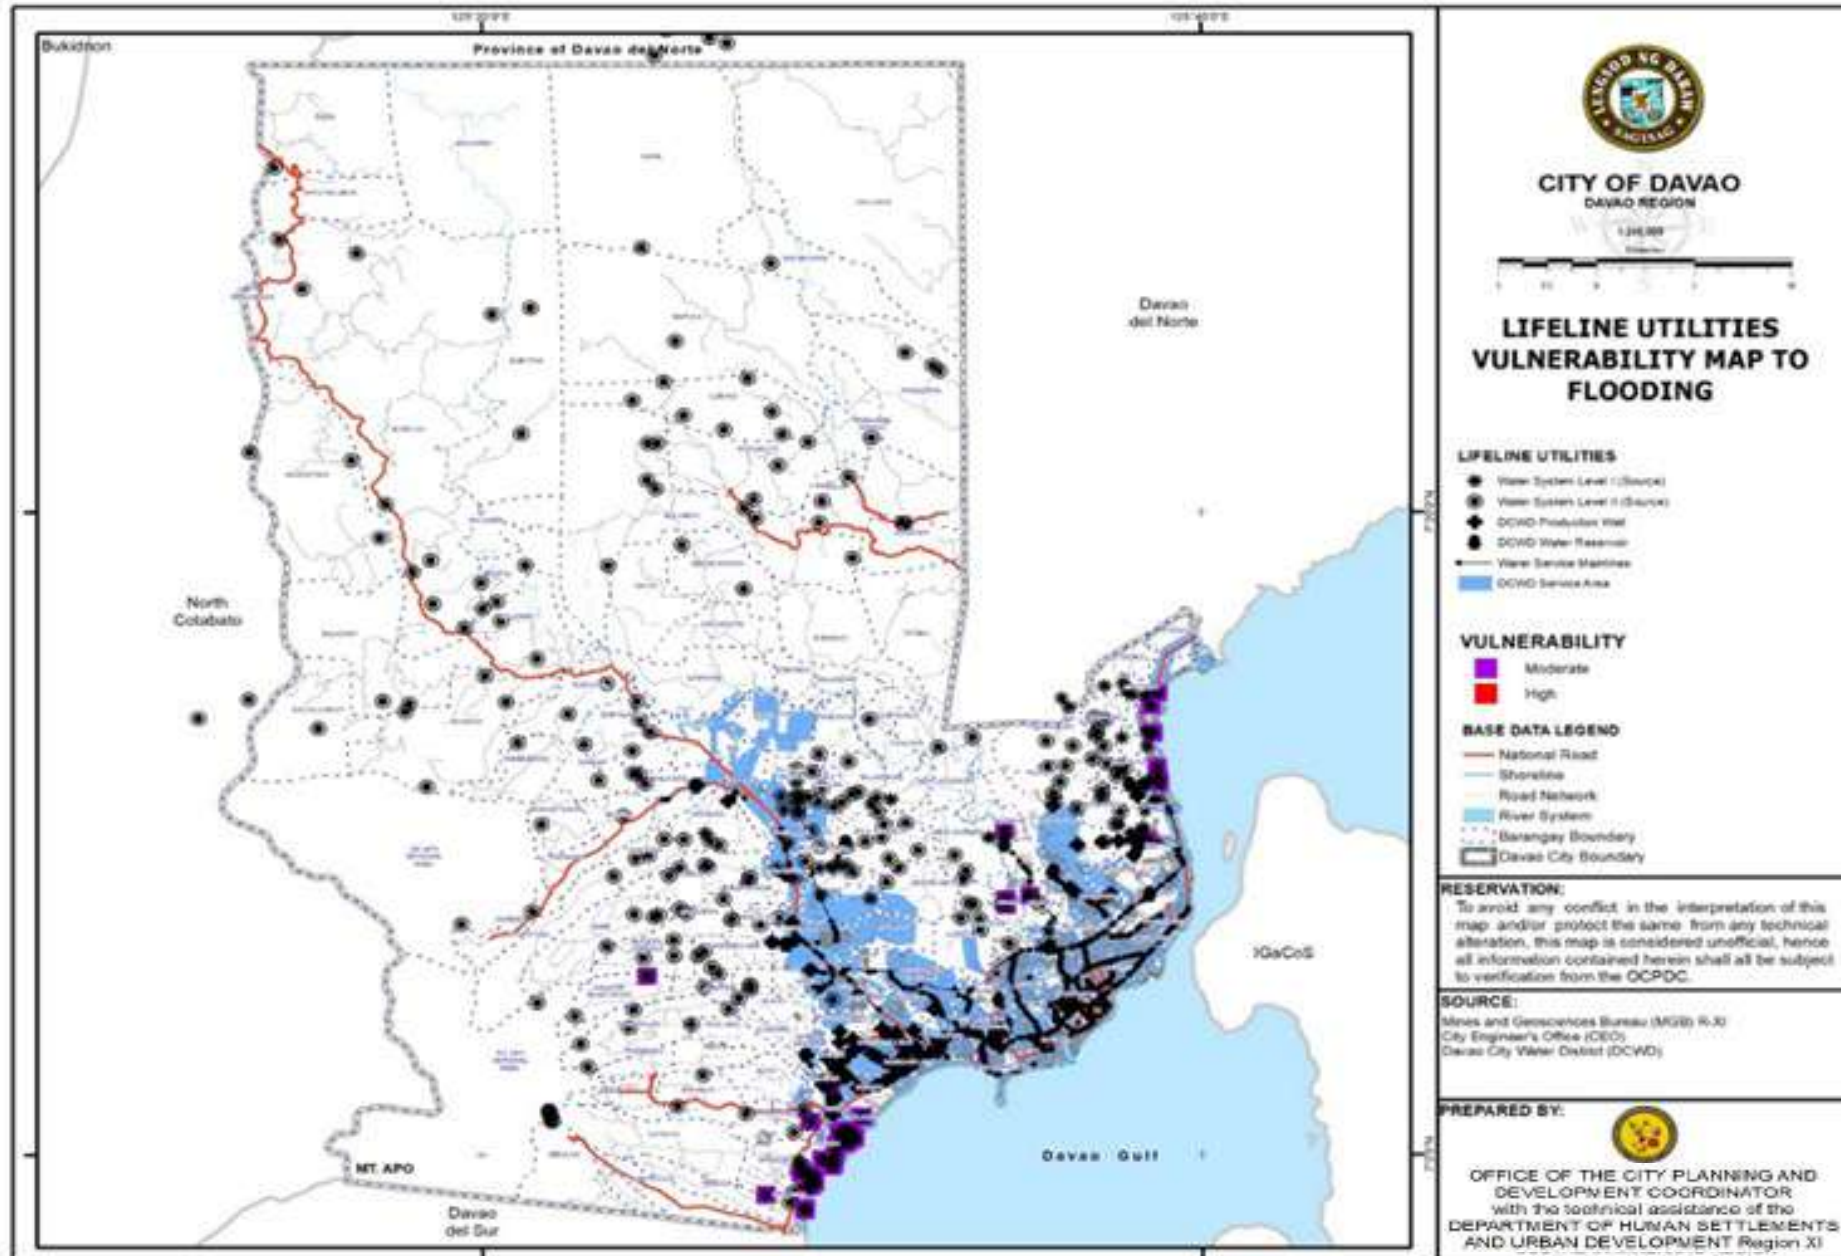

Level III Water Supply -A total of five mainlines in Bago Aplaya ranging from (400-600 mm) in diameter are moderately vulnerable to flood.

Map 1. 41 Lifeline Utilities Vulnerability Map Flooding, Davao City

Lifeline Utilities Vulnerability to Flood

Map 1. 42 Lifeline Utilities Vulnerability Map Flooding, Davao City

Lifeline Utilities Vulnerability to Landslide

A total road length of 60.8778641 kilometers is highly vulnerable to landslide. It is divided among four road networks. (Carlos P. Garcia Highway, Davao-Bukidnon Road, Fatima- Malabog Roads and Toril-Bayabs-Eden Road)

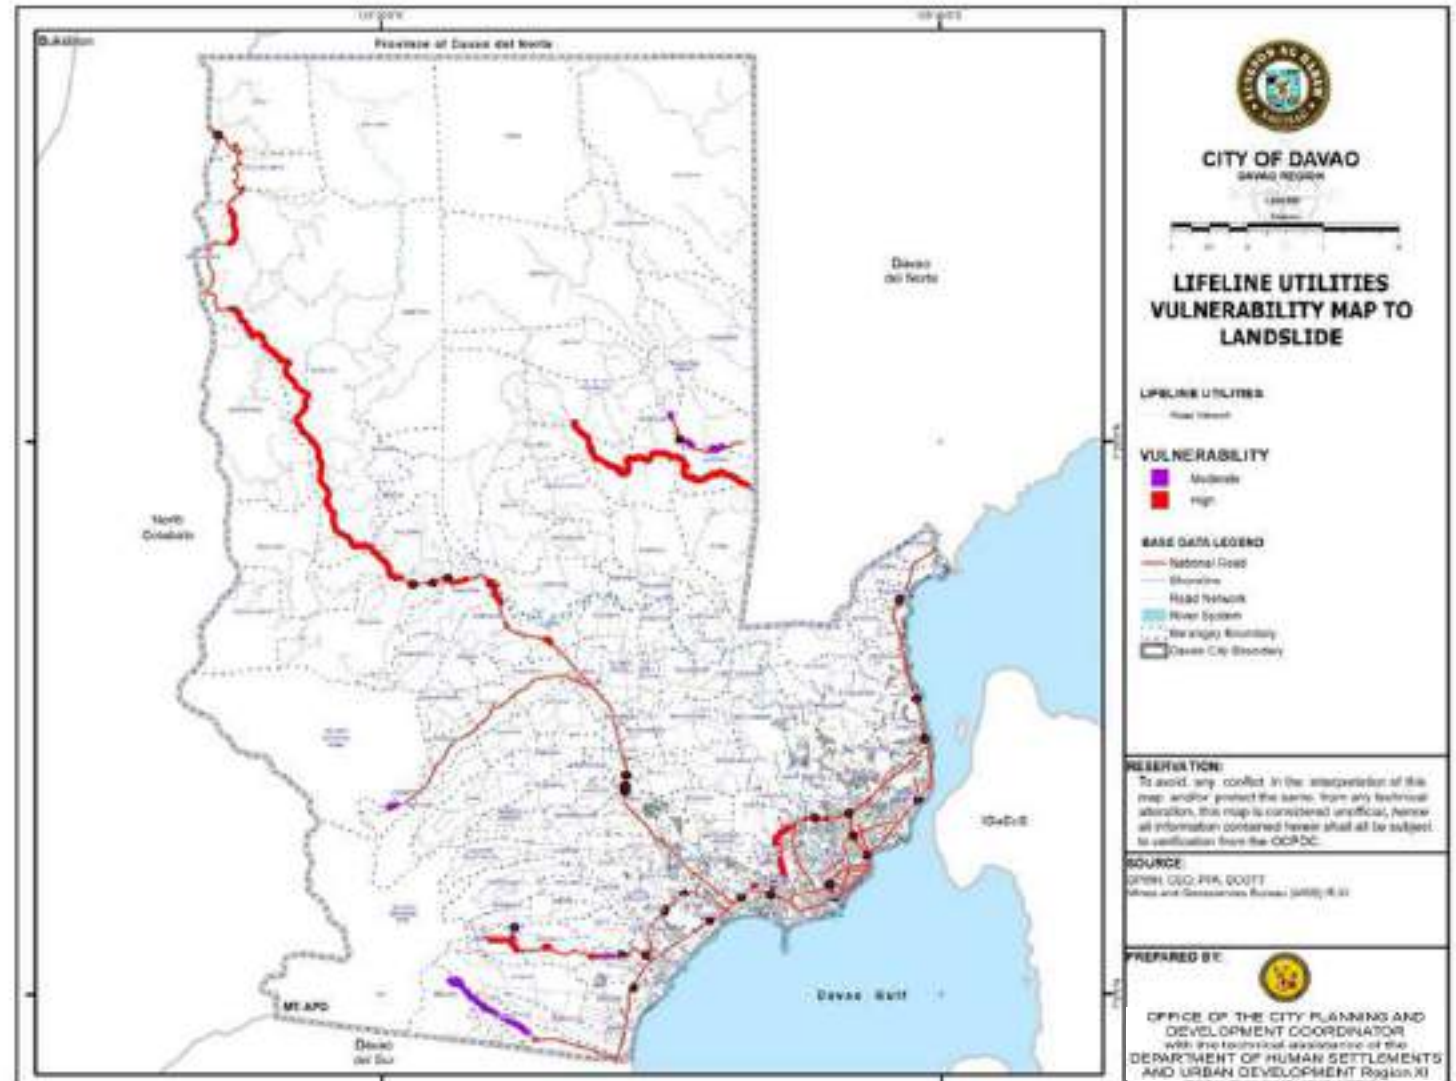

A total of three bridges are moderately vulnerable to landslide and these are Baracatan Bridge, Crossing Malabog Bridge and Tagurano Bridge

Tibungco Substation, the substation which is the only one susceptible to landslide has low vulnerability to landslide

A total of 74 spring sources found in Baguio District, Calinan District, Marilog District, Paquibato District, Toril and Tugbok District have high vulnerability to landslide.

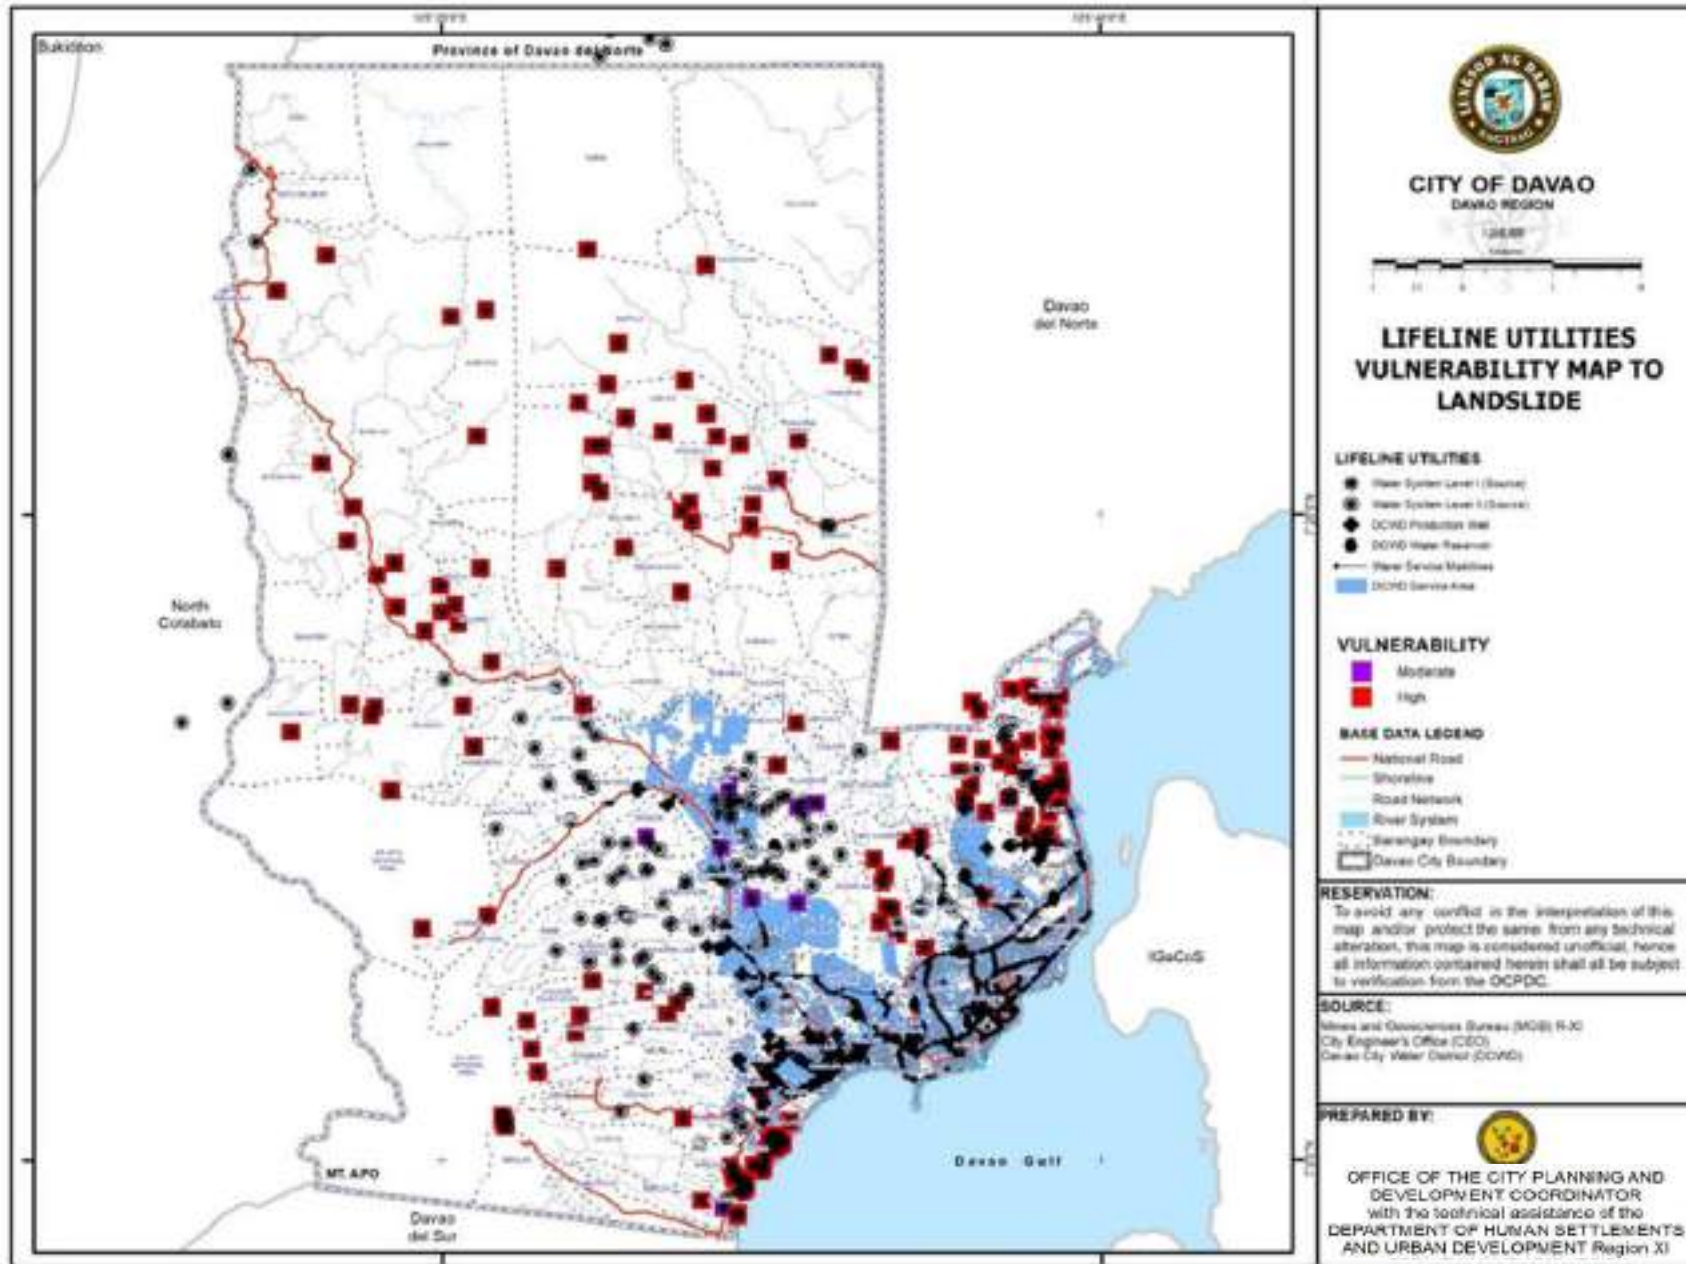

Level III Water sources, DCWD Wells, have low landslide vulnerability.

Map 1. 43 Lifeline Utilities Vulnerability Map to Landslide, Davao City

Lifeline Utilities Vulnerability to Landslide

Map 1. 44 Lifeline Utilities Vulnerability Map to Landslide, Davao City

Lifeline Utilities Vulnerability to Active Fault/Fault Line

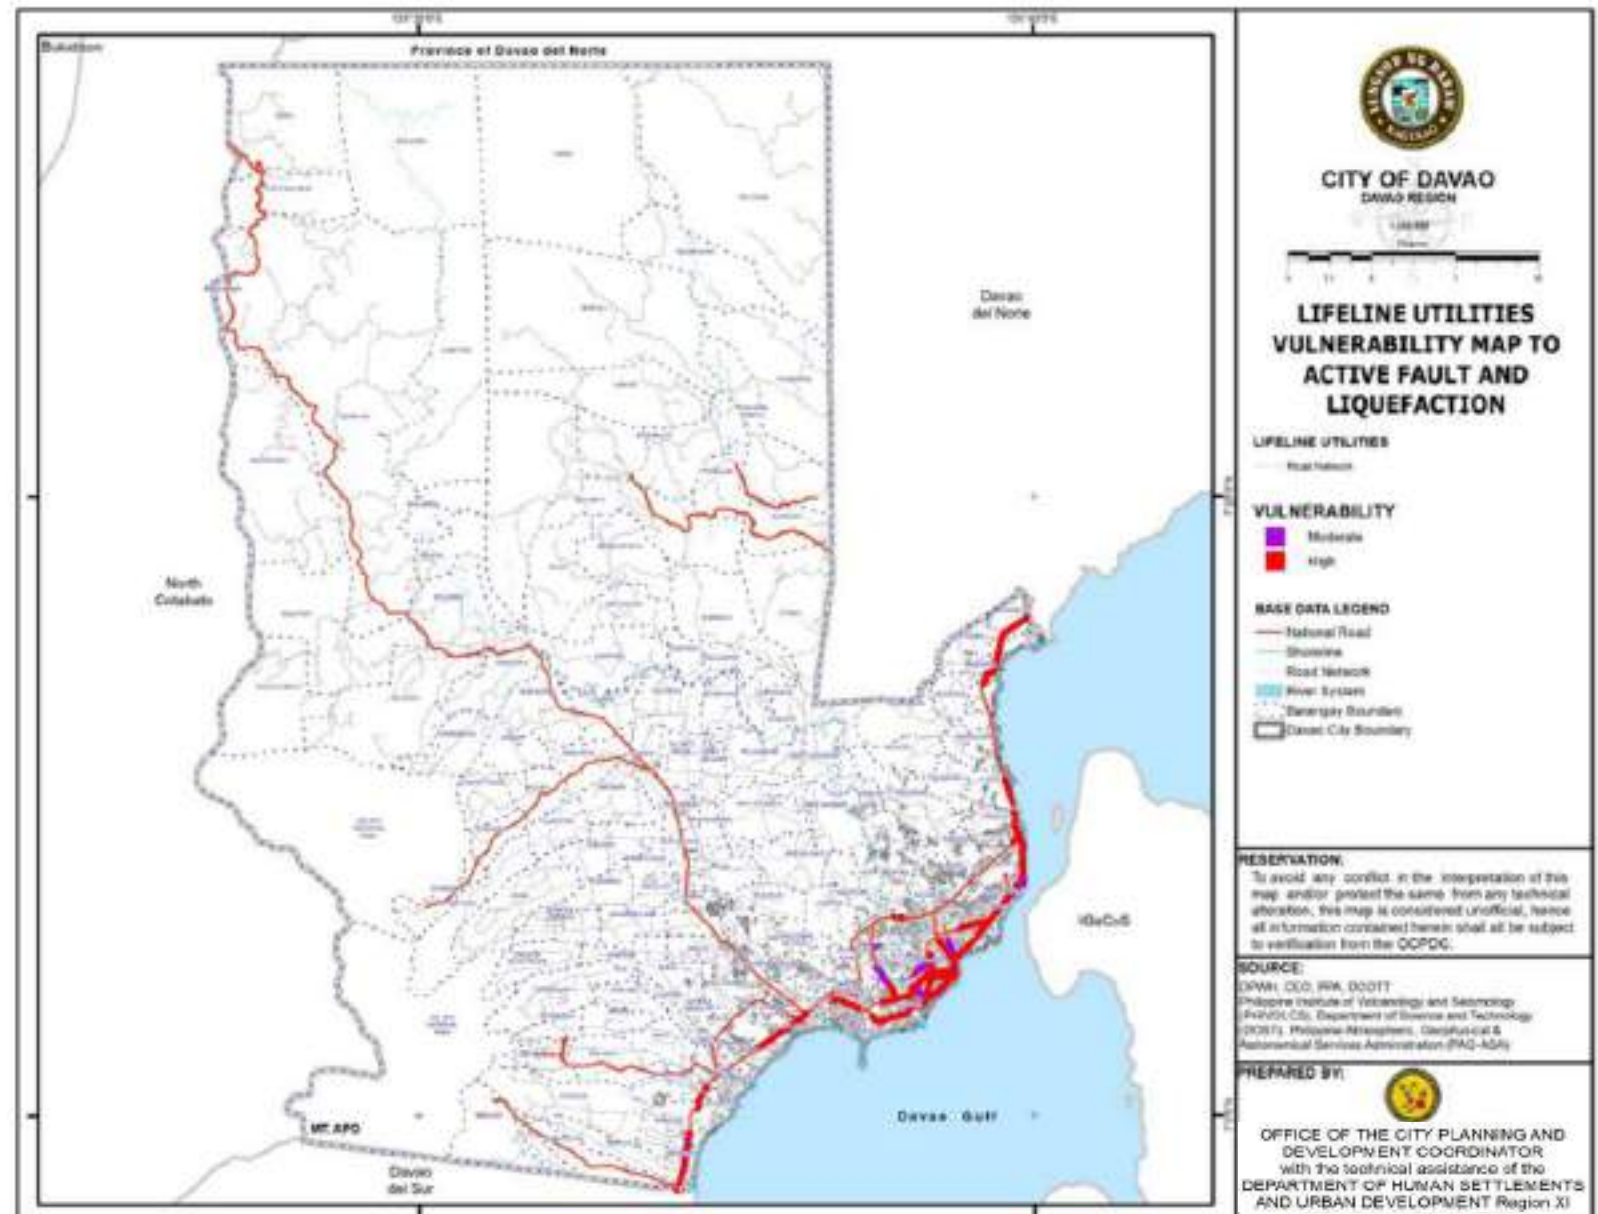

A total of 0.0760 kilometers of Davao Bukidnon Road is moderately vulnerable to earthquake.

Lipadas Bridge 1 and Lipadas Bridge 2 are moderately vulnerable to earthquake.

A 3-horsepower well found in Manambulan is highly vulnerable to earthquake.

For Level 3 Water System, 11 mainline pipes found in Wangan, Calinan, Tugbok, Mintal, Catalunan Grande, Talomo, and Los Amigos are moderately vulnerable to Fault Line

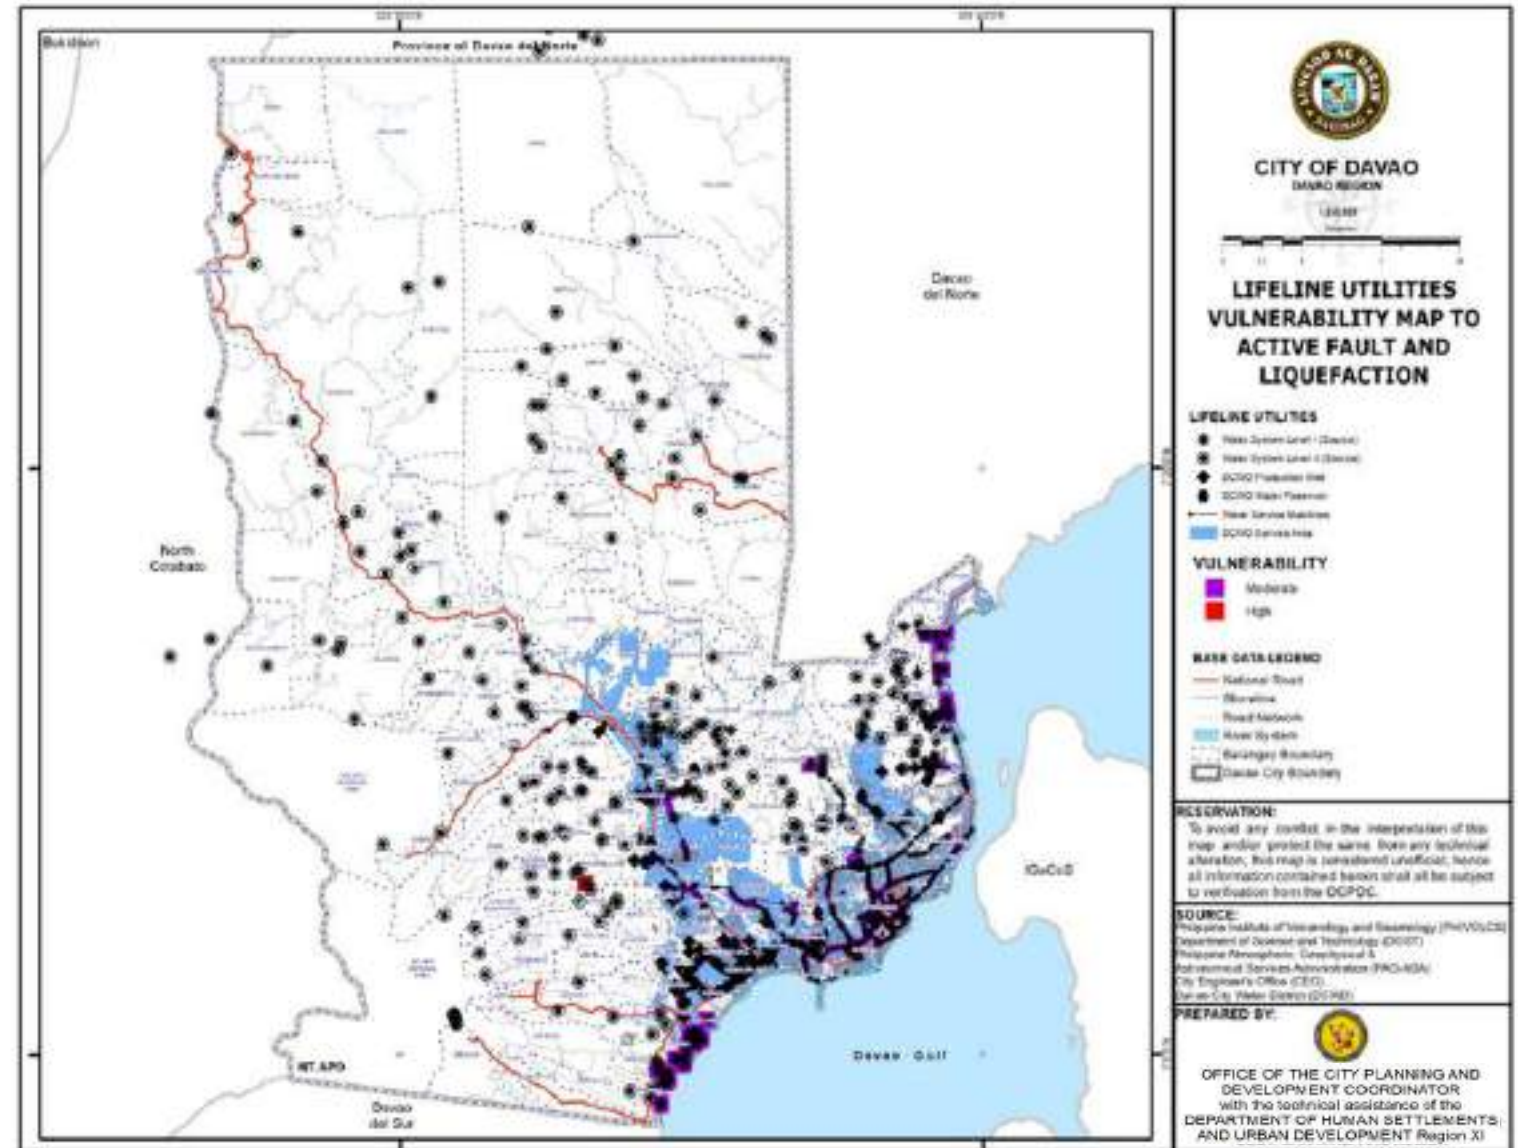

Map 1. 45 Lifeline Utilities Vulnerability Map to Active Fault and Liquefaction, Davao City

Lifeline Utilities Vulnerability to Liquefaction

- 16 road networks are highly vulnerable to liquefaction
- Agdao Flyover and Pangli Bridge are moderately vulnerable to liquefaction
- A total of 13 Substations have low vulnerability to liquefaction
- 52 spring sources in Binugao, Bunawan, Mahayag, Mandug, Panacan, Daliao, Bunawan, Lizada are moderately vulnerable to liquefaction.
- Wells in Srawan, Bunawan, and Waan all have low liquefaction susceptibility
- A total of 433 mainline pipes are moderately vulnerable to liquefaction.
- All four wells susceptible to landslide have low vulnerability.
- A total of 13 cellsites are moderately vulnerable to liquefaction.

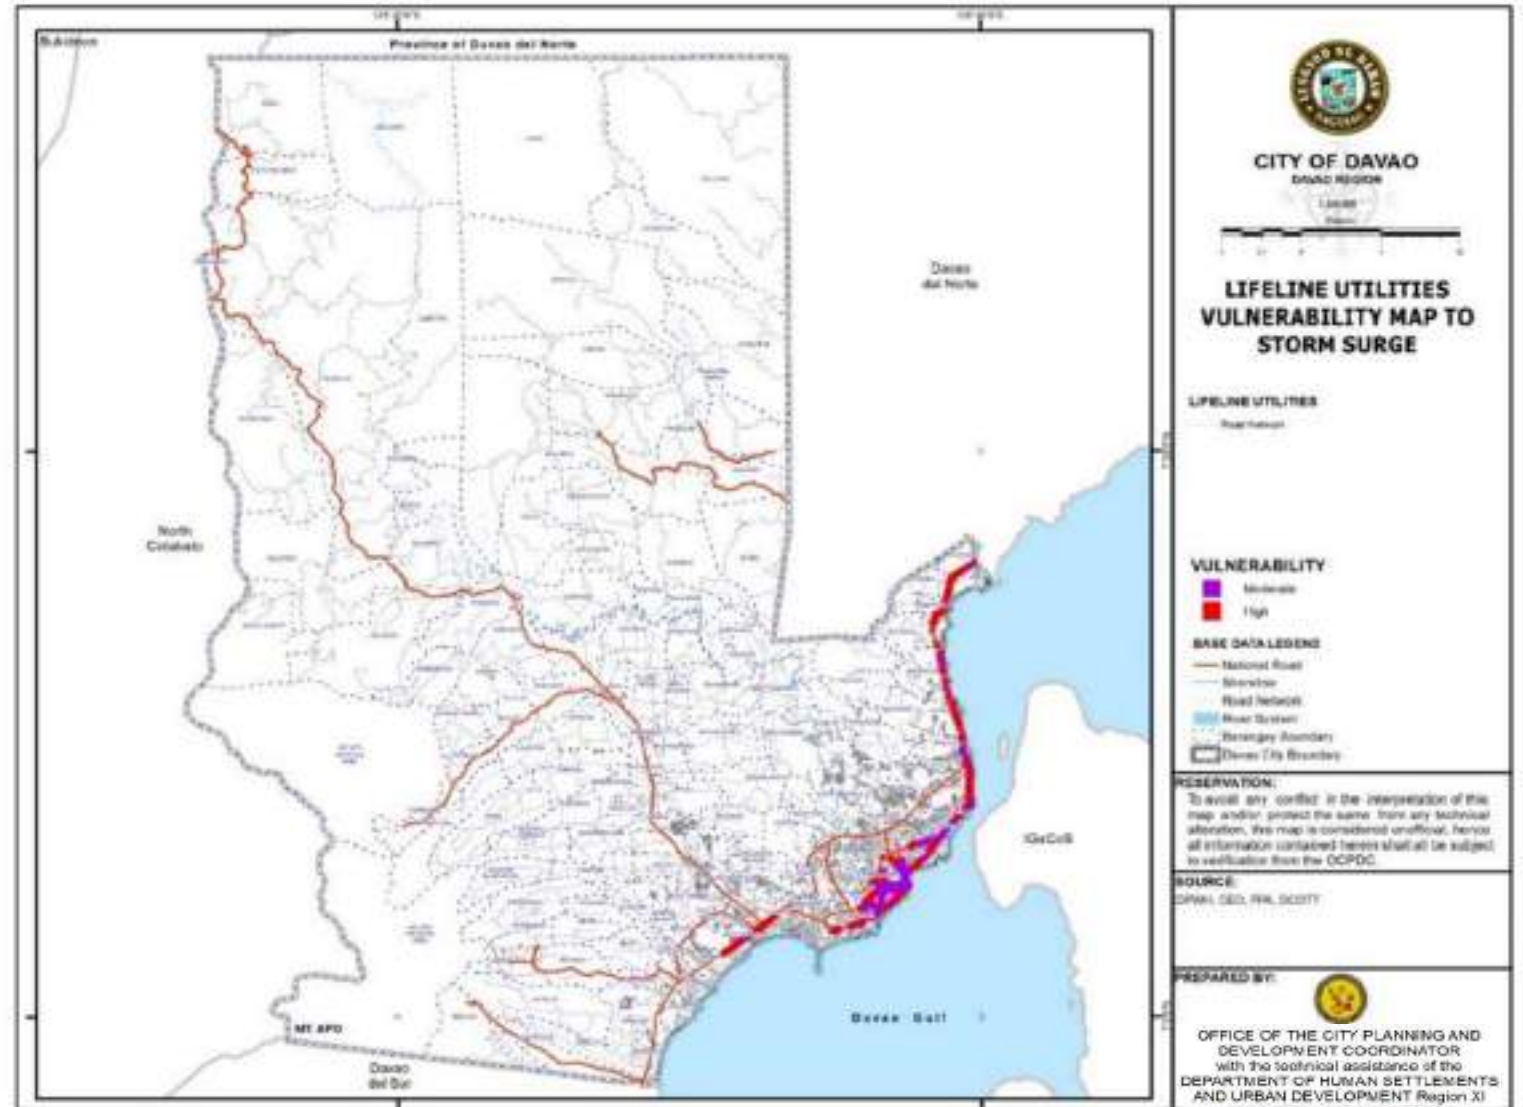

Map 1. 46 Lifeline Utilities Vulnerability Map to Active Fault and Liquefaction, Davao City

Lifeline Utilities Vulnerability to Storm Surge

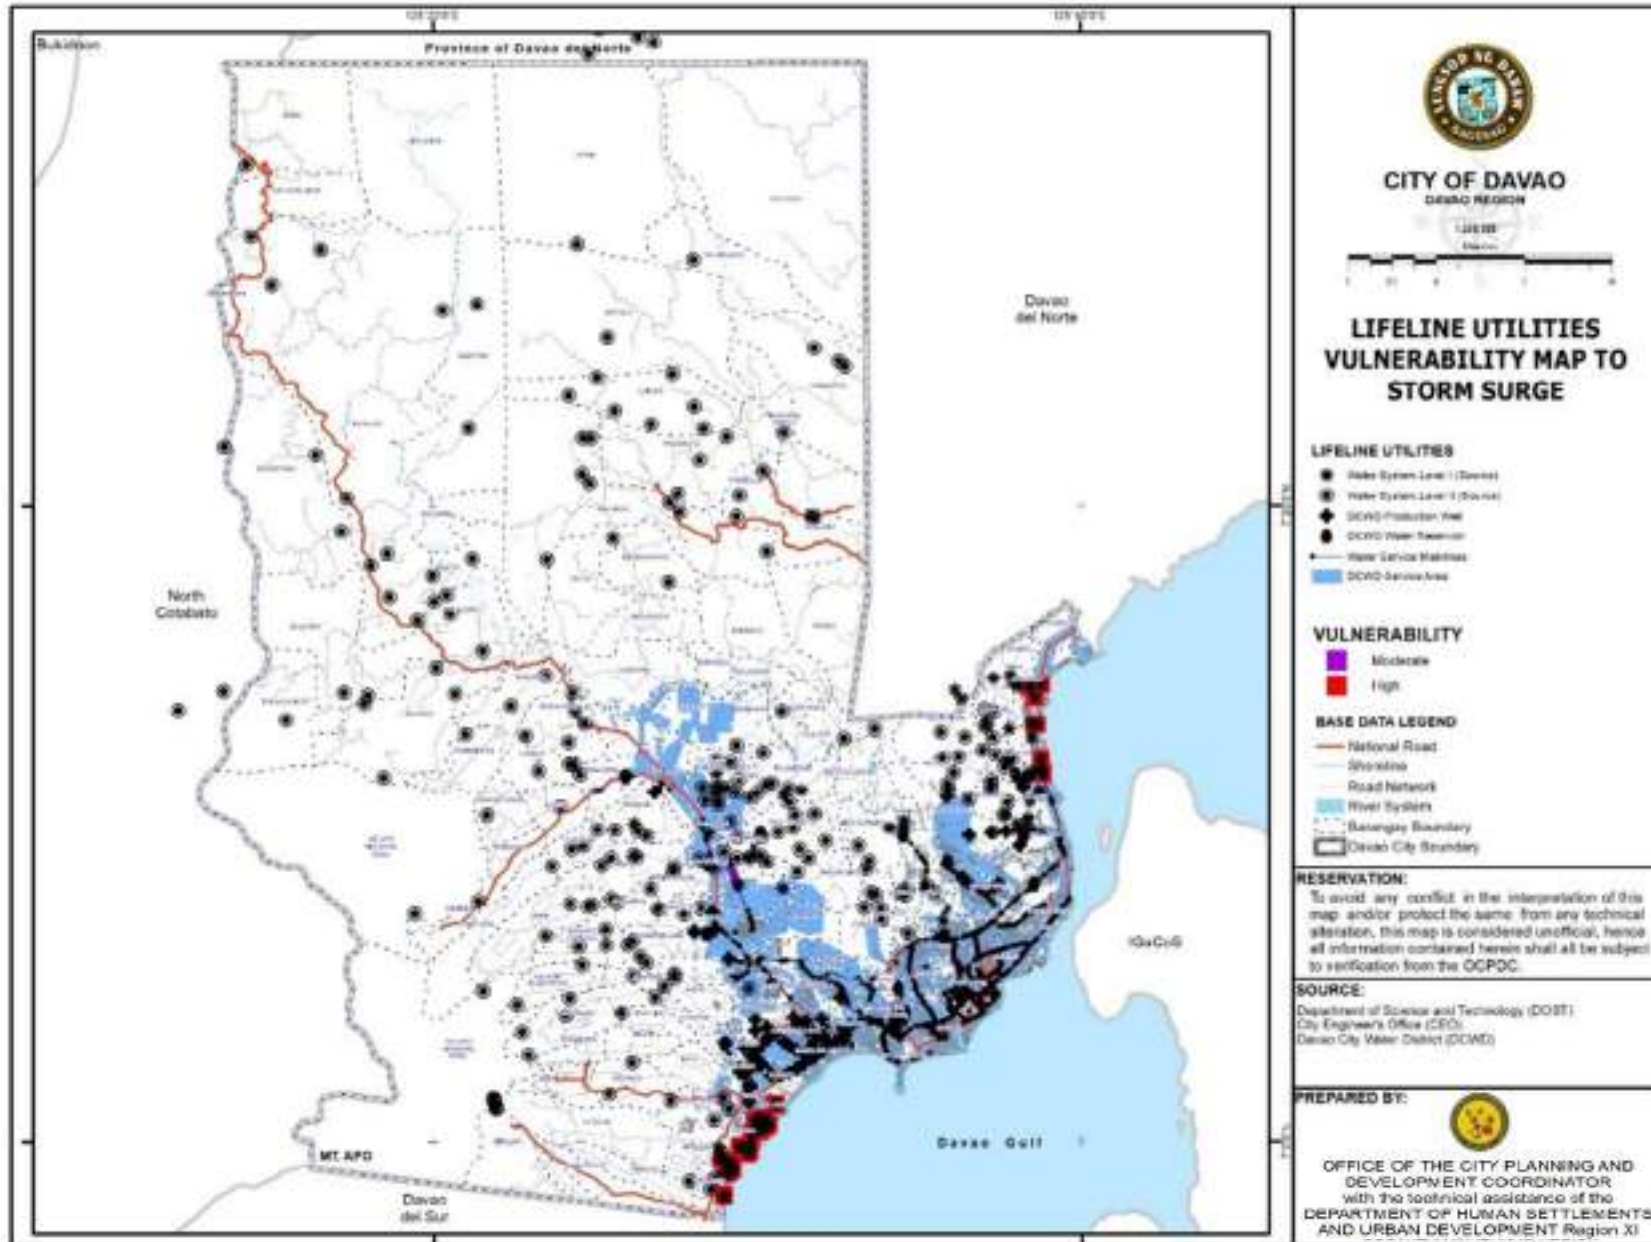

- Portions of C.P Garcia Highway, Dacudao Avenue, Davao-Agusan Highway, Florentino Torres St., J.P. Cabaguio, J.P Laurel, Libby Road, McArthur Highway, Old Airport, Pichon St., Quimpo Boulevard, Quimpo Avenue, and McArthur Highway are highly vulnerable to storm surge.
- Almost all bridges have low vulnerability due to high adaptive capacity for storm surge.
- All power substations have low vulnerability.
- All spring sources which are susceptible to storm surge have high vulnerability to storm surge.
- The two wells which are susceptible to 2-meter wave are moderately vulnerable this is due to the high degree of impact and low adaptive capacity.
- Pipelines in Dumoy, Bago Aplaya, Talomo, Ilang, and Matina Aplya are moderately vulnerable to storm surge with 5-meter wave.
- All DCWD wells have low vulnerability to storm surge.
- Two cell sites in Bunawan, one in Lasang and one in Toril have moderate vulnerability to storm surge with 4-meter wave.

Disaster Risk Assessment for Flood

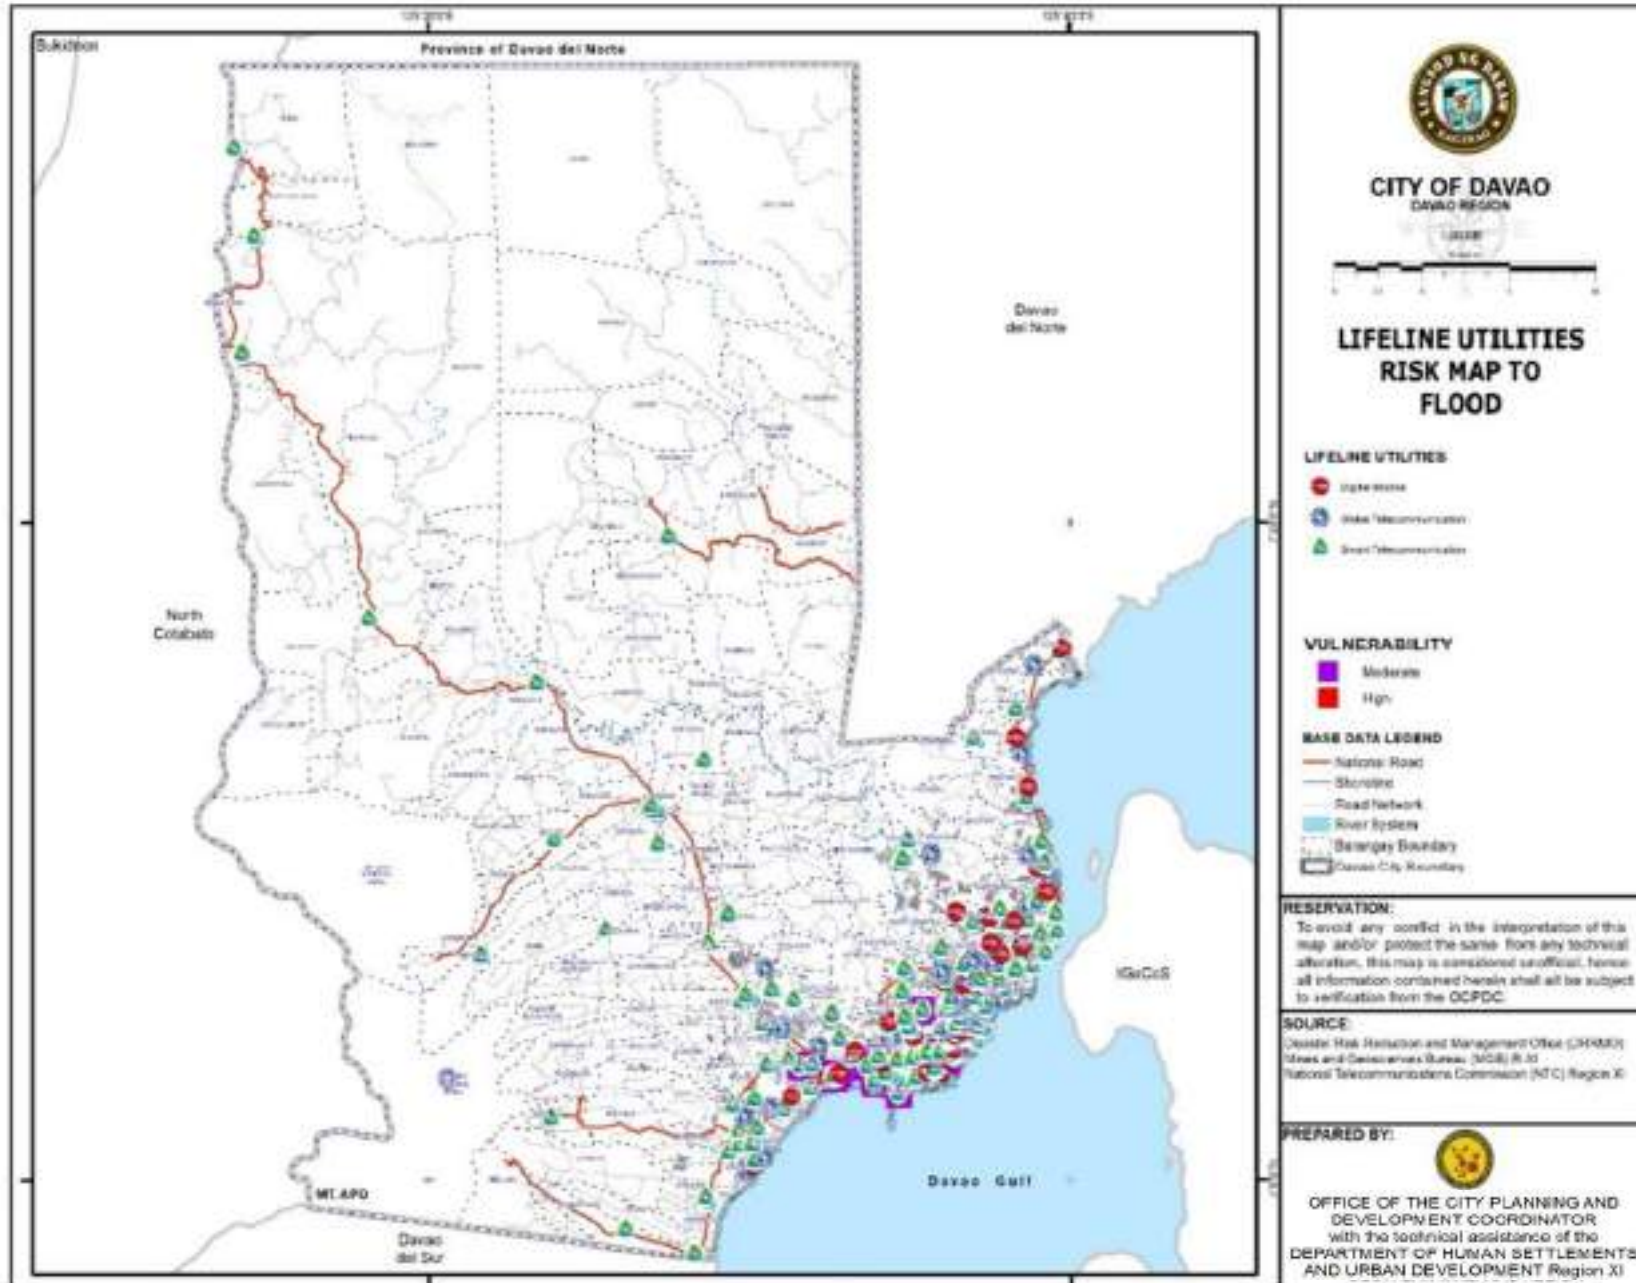

- A total of 6.56 kilometers of road are moderately at risk to flood.
- Matina Bridge, Pagan Grande, Pangí Bridge, and Tamugan Bridge have high risk score.
- Calinan, Tugbok and Matina Substation are moderately at risk to flood.
- Out of 33 sources which are moderately and highly susceptible to flood with corresponding likelihood of occurrence in their area, a total of 21 sources are at high risk to flood.
- 116 mainline pipes are at high risk of flood. These mainlines are found in 19-B, Ma-a, Mandug, Matina aplaya, Matina crossing, Matina Pangí, Talomo, Tigatto and Tugbok.
- A total of 12 wells located in Talomo, Bago-Aplaya, Tugbok and Los Amigos are at moderate risk of flood.
- 26 cell sites are at moderate risk to flood.

Map 1. 50 Lifeline Utilities Risk Map to Flood, Davao City

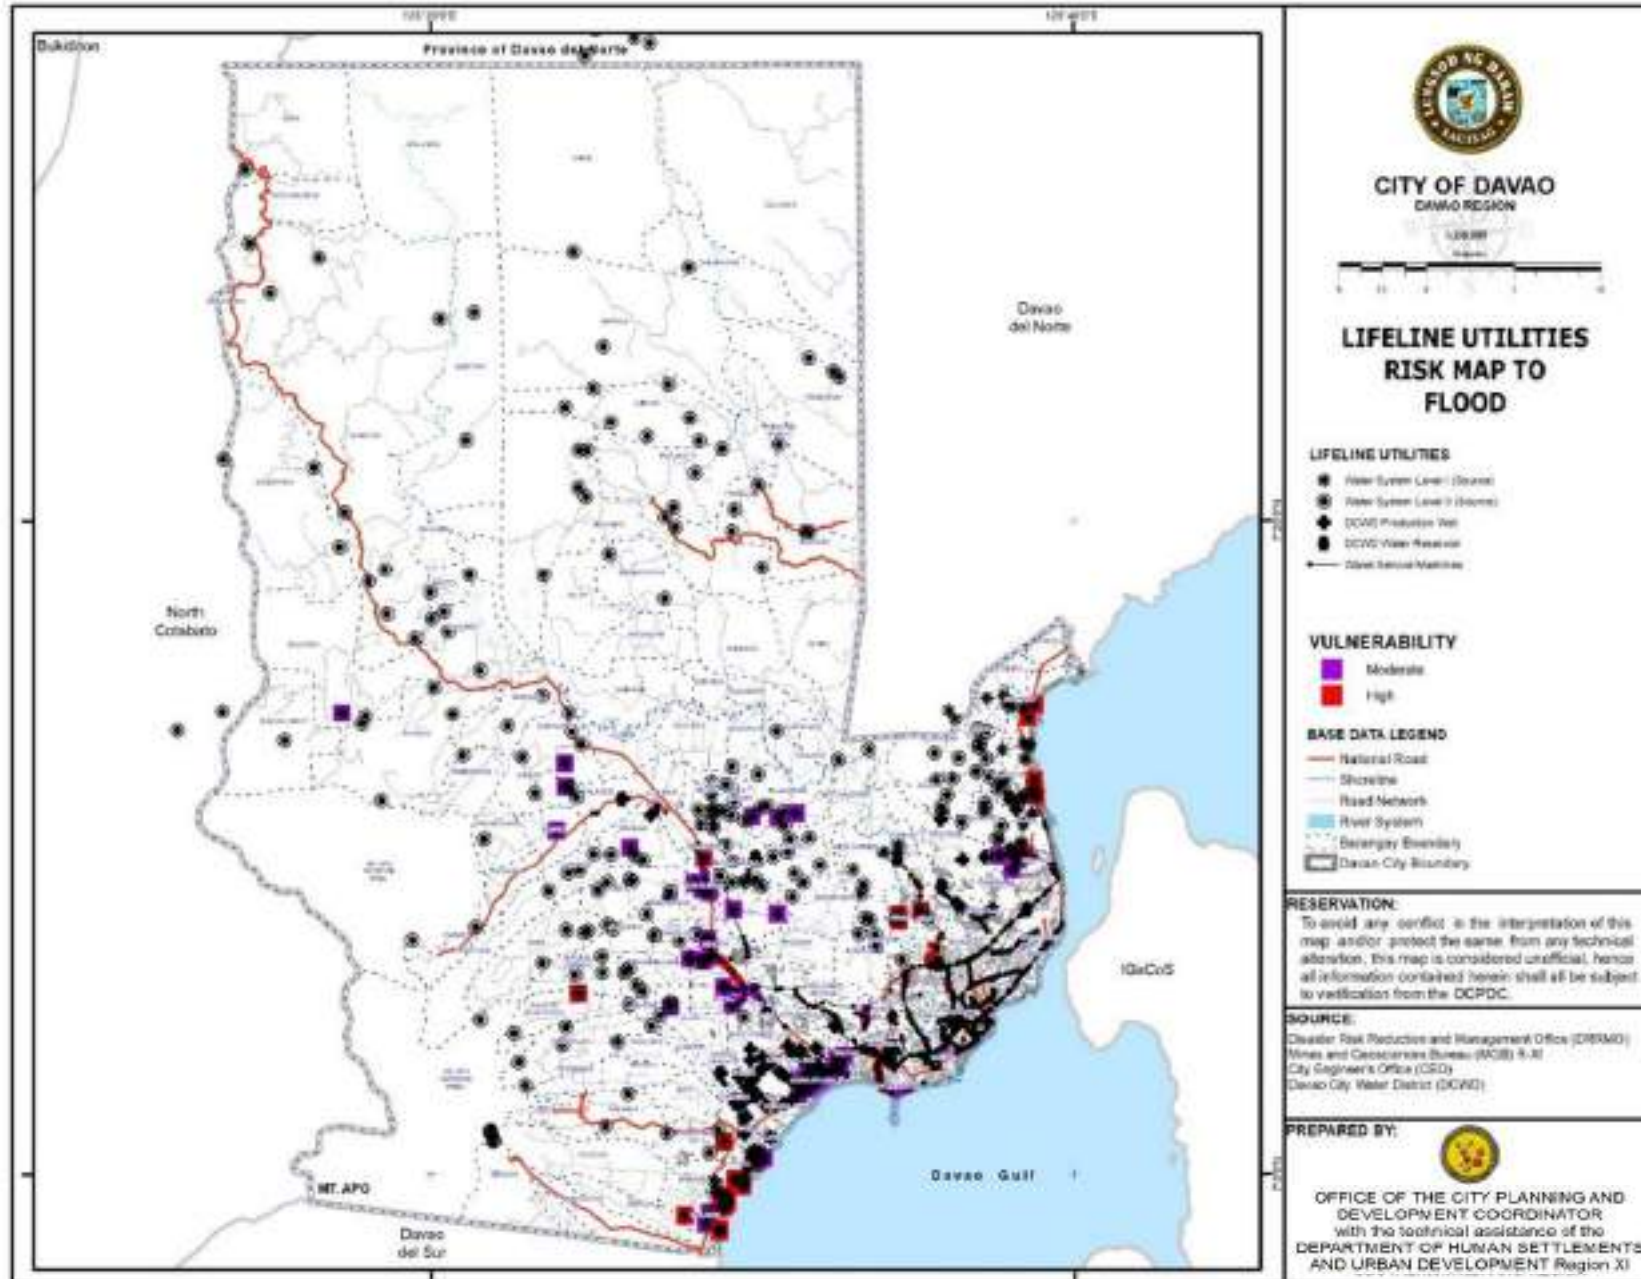

Disaster Risk Assessment for Flood

Map 1. 51 Lifeline Utilities, Cell Sites, Risk Map to Flood, Davao City

Disaster Risk Assessment for Flood

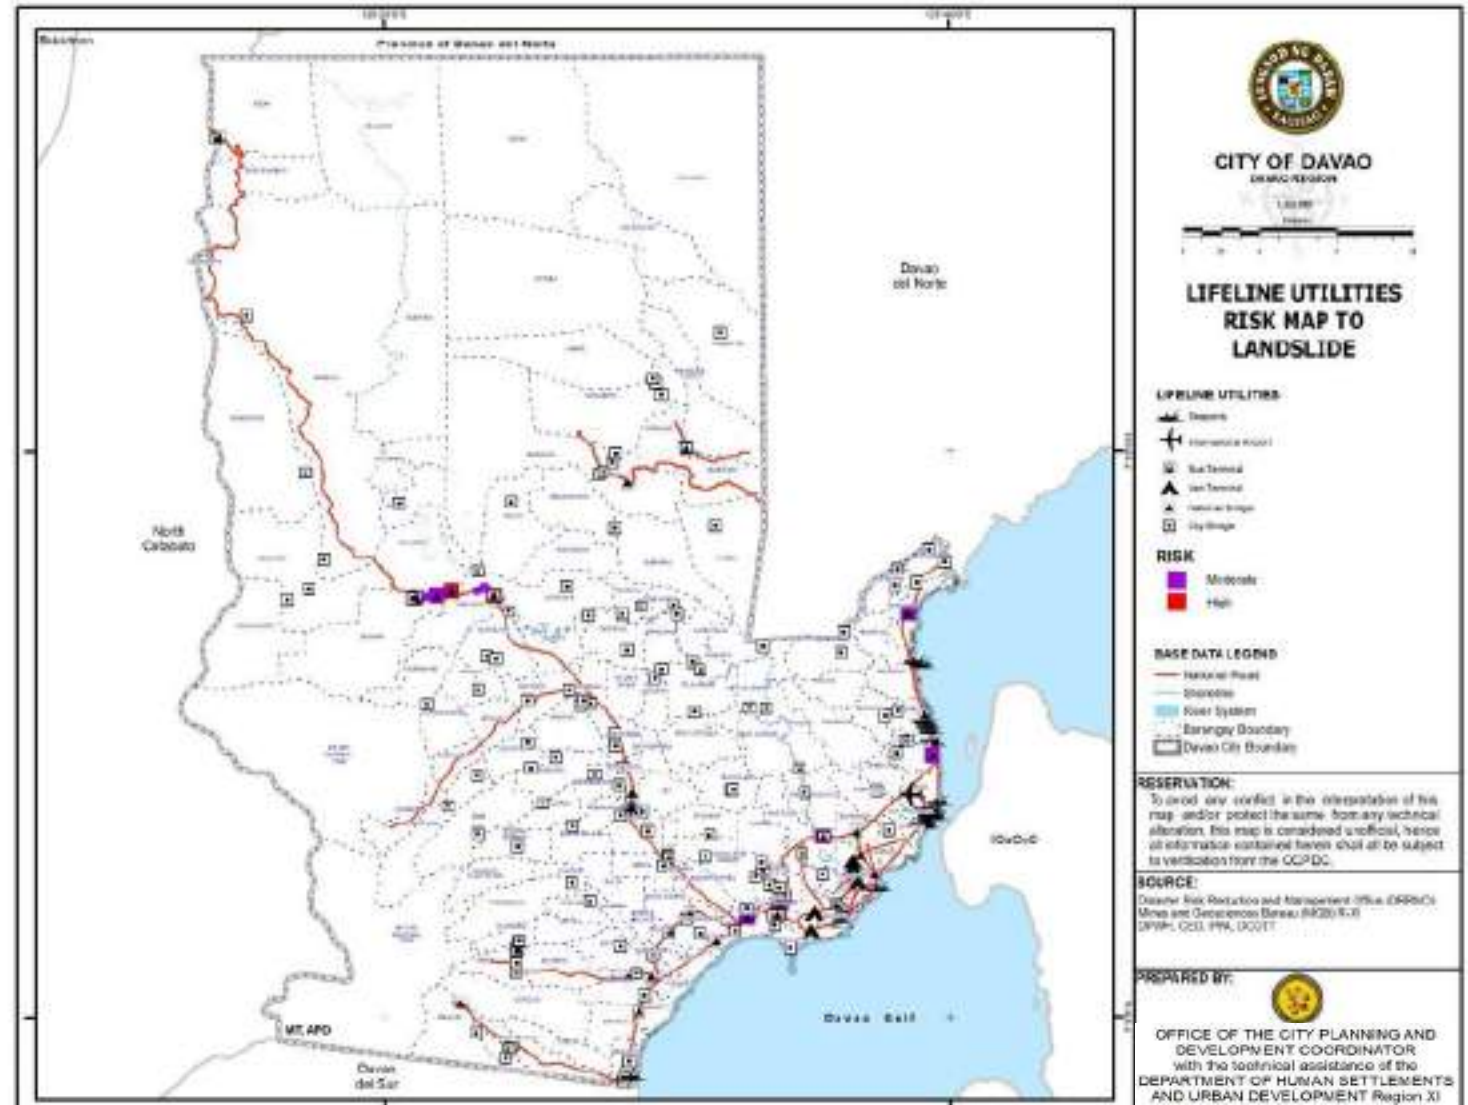

Map 1.52 Lifeline Utilities, Water Utilities , Risk Map to Flood, Davao City

Disaster Risk Assessment for Landslide

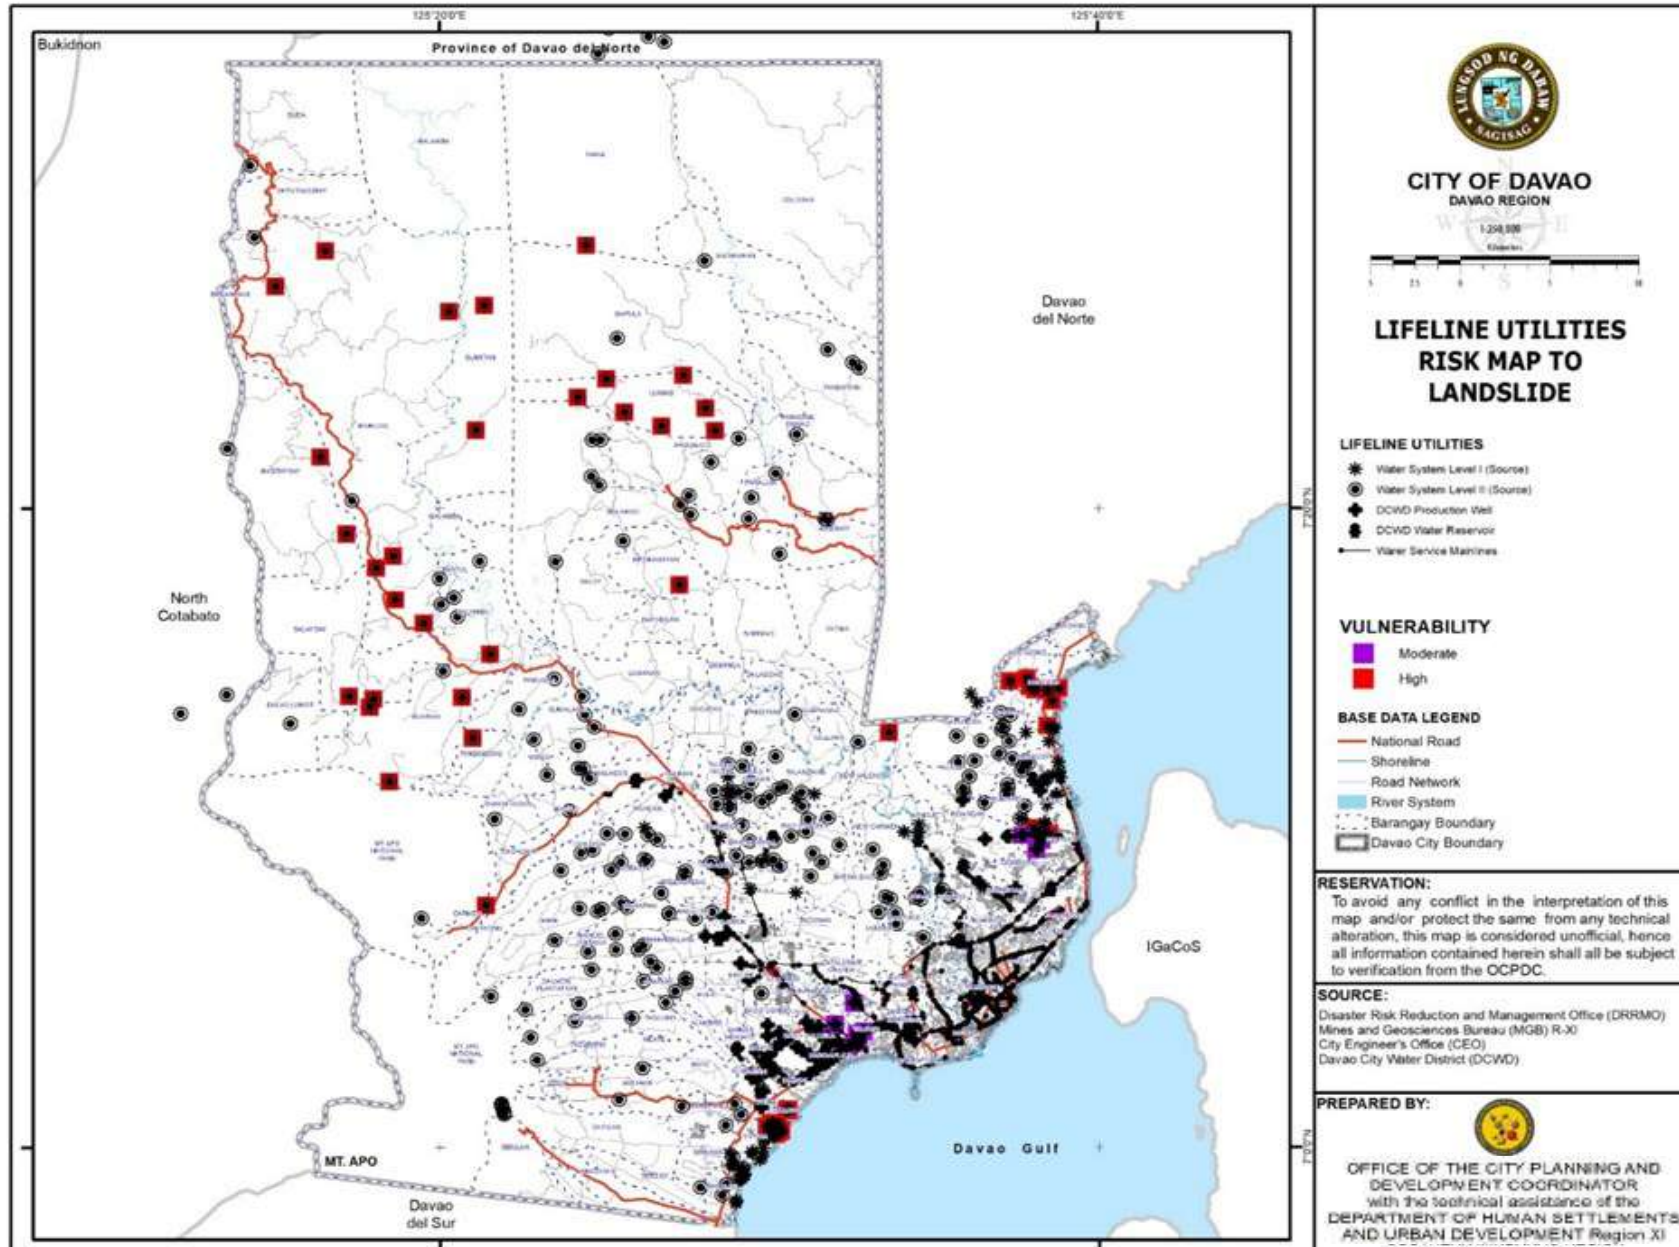

- A total of 0.67 kilometers of Davao-Bukidnon Road is at high risk to landslide, while 5.57 kilometers of C.P Garcia Highway is moderately at risk of landslide
- Spring sources in Bunawan, Panacan, Daliao San Isidro are at high risk to landslide incidents
- For Level II Water System, a total of 28 spring sources and one well found in barangays Callawa, Carmen, Gumitan, Lumiad, Magsaysay, Marilog, Megkwayan, Suawan, Tambobong and Tapak are at high risk of landslide
- A total of 8,112.84 meters of mainline pipes are at high risk of landslide.
- Wells located in Purok 27 and Purok 24 of Barangay Panacan are in moderate risk for landslide.
- A total of 23 out of 26 cell sites are assessed to be moderately at risk to landslide. These cell sites are found in Matina Aplaya, Matina Crossing, Ma-a Talomo, Talomo Proper and Bucana.

Natural Resource-Based Production Area Exposure to Flood

- A total of 129 barangays, which have NRBPAs, are susceptible to floods.
- Of the total, 82 barangays are mostly planted with coconuts, which occupy a combined land size of 77,489 hectares and reap an annual average output per hectare at ₱2,983,870.
- There are also 4,583 farming families who attended climate field school, 4,659 farming families who use sustainable production techniques, and 5,463 farmers who have access to hazard information.
- The remaining barangays, on the other hand, have different dominant varieties.
- Vegetables- dominant in Buda and Salumay (2,104.36 hectares).
- Rice- largely planted in Calinan, Gumitan, and Los Amigos (1,790.22 hectares).
- Corn- widely planted in Lumiad, Baganihan, and Magsaysay (2,635 hectares).
- Bananas- are propagated in in Tigatto, San Isidro, Sirib, Tamayong, Salaysay, Bago Aplaya, Pañalum areas and Dalian Plantation (7,798.81 hectares), whether for local or international markets.
- Pelagic fishes- dominate in Matina Aplaya and Lasang (460.68 hectares).
- Catfish (hito)- propagated in Los Amigos (27.50 hectares).
- Pineapples (777.62 hectares), mango (730.75 hectares) and abaca (501.15 hectares)- Barangays Cawayan, Sirawan, and Sibulan.

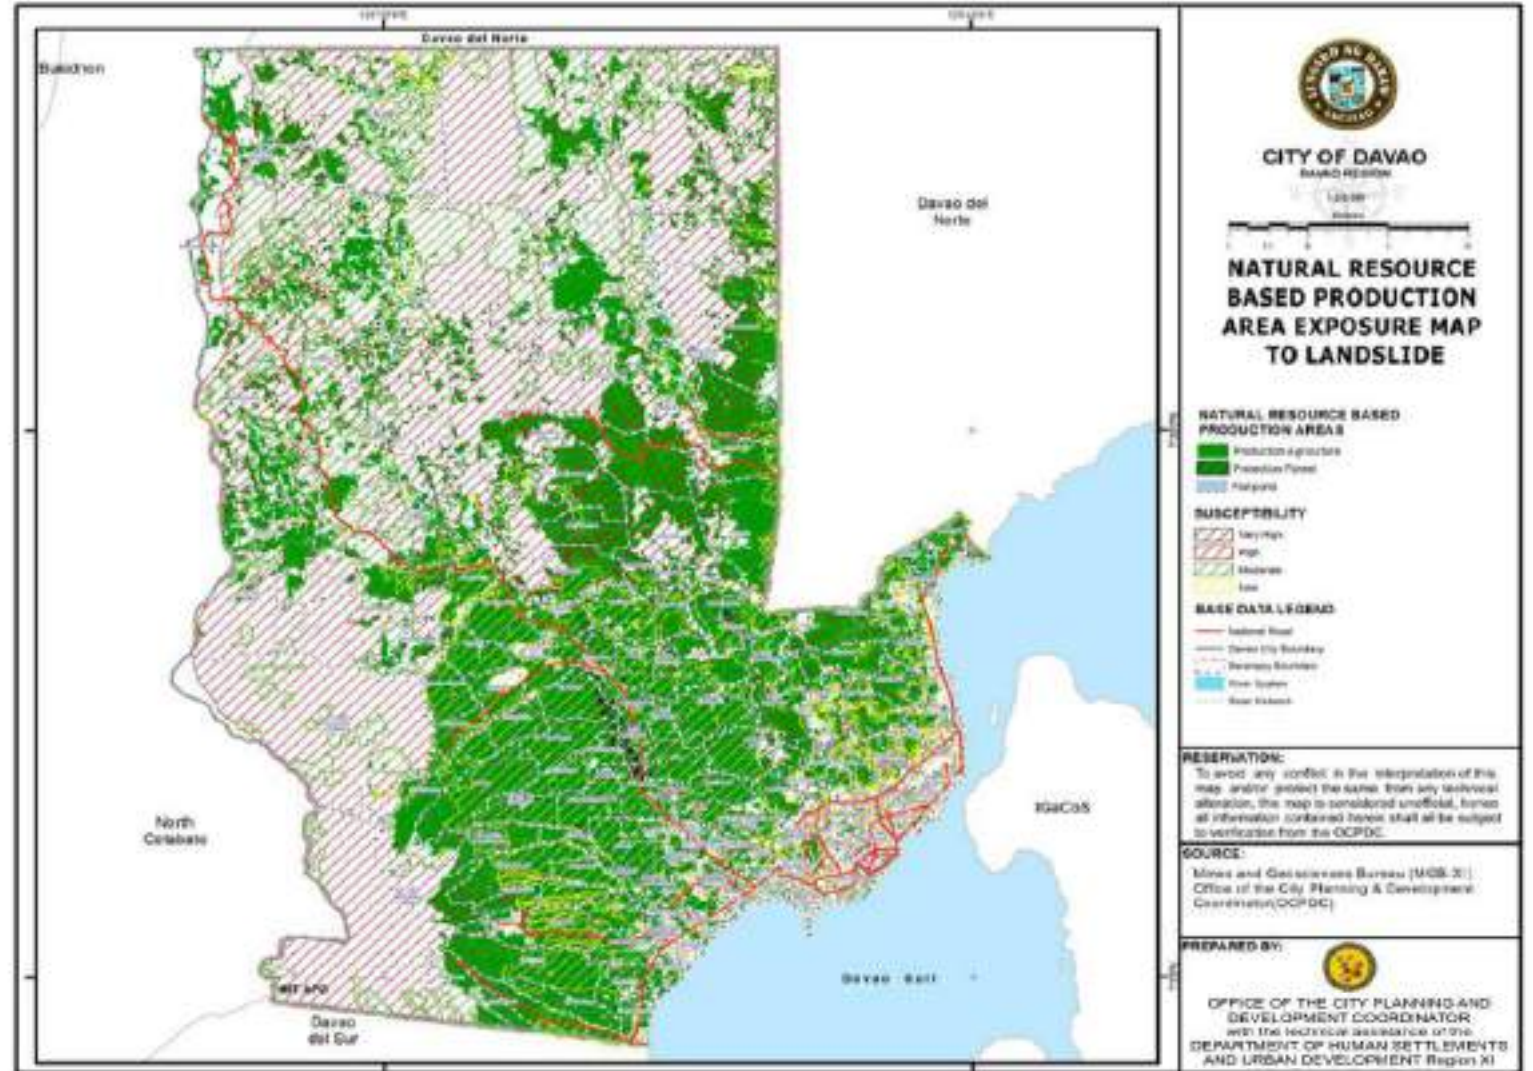

Map 1.57 Natural Resource Based Production Area Exposure Map to Flood , Davao City

Natural Resource-Based Production Area Exposure to Landslide

- At least 128 barangays, which have NRBPA, are susceptible to landslides.
- The dominant crop in these areas are coconuts, which occupy to 77,489.04 hectares in 82 barangays.
- These coconut farms are source of income for 53,617 farming dependent households. Farmers in these areas are also educated on the impacts of climate change and are able to utilize sustainable production techniques.
- If ever the farms would be affected by landslides, a total of 4,200 farmers in these areas have access to insurance. At least 9,800 of them have alternative livelihood. Other areas have different dominant varieties. All of these areas have early warning systems in case of emergencies.

Map 1.58 Natural Resource Based Production Area Exposure Map to Landslide , Davao City

Natural Resource-Based Production Area Exposure to Liquefaction and Fault line

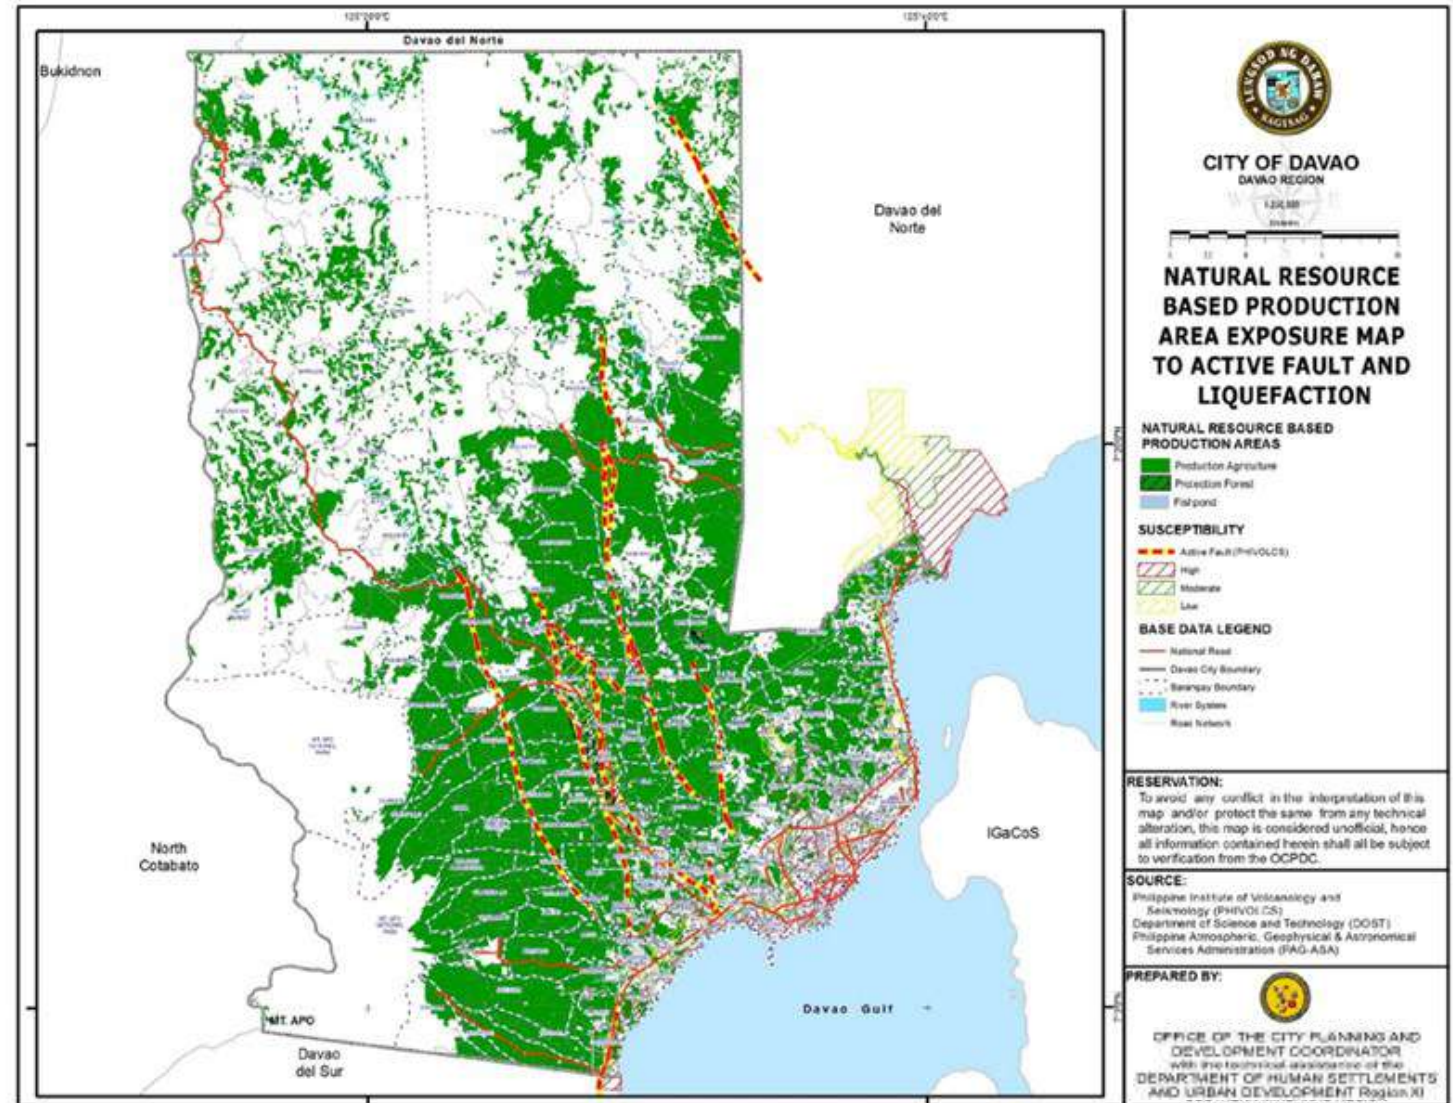

Map 1.60 Natural Resource Based Production Area Exposure Map to Active Fault and Liquefaction , Davao City

Liquefaction

- A total of 49 barangays with NRBPA are susceptible to liquefaction. Half of these have coconuts as dominant crop.
- All of these sites have 141,980 farming dependent households, though only 0.48% of them have attended climate field school.
- Only 0.54% of the farming dependent households are also able to use sustainable production techniques.
- At least 683 farmers have access to hazard information while 1,016 individuals have alternative livelihood.

Fault Line

- Fault line systems are present in 54 barangays, which have NRBPA.
- Most of the barangays with NRBPA but have presence of fault line systems are planted with coconuts, which have a combined annual output per hectare of ₱1,674,568.
- All of these sites have 110,936 farming dependent households.
- Of the total number, only 2.32% are able to attend climate field school. Only 2.12% of the farming dependent households are able to use sustainable production techniques. At least 1.98% of them have access to insurance while 4.31% have alternative livelihood.
- Should there be movements in the fault line systems, the City Government have resources to respond and provide aid to the farming households. There are also early warning systems that are installed in the affected barangays.

Natural Resource-Based Production Area Adaptive Capacity

Flood– NRBPA in nine (9) barangays have the lowest adaptive capacity. These areas have the lowest adaptive capacity should there be flooding incidents in the areas. Among these include Malabog, Mapula, Pandaitan, Baganihan, Dalag Lumot, Datu Salumay, Tapak and Gumitan. In case when their sources of income (e.g. farming, livelihood) would be affected by floods, a total of 2,120 individuals have alternative livelihood.

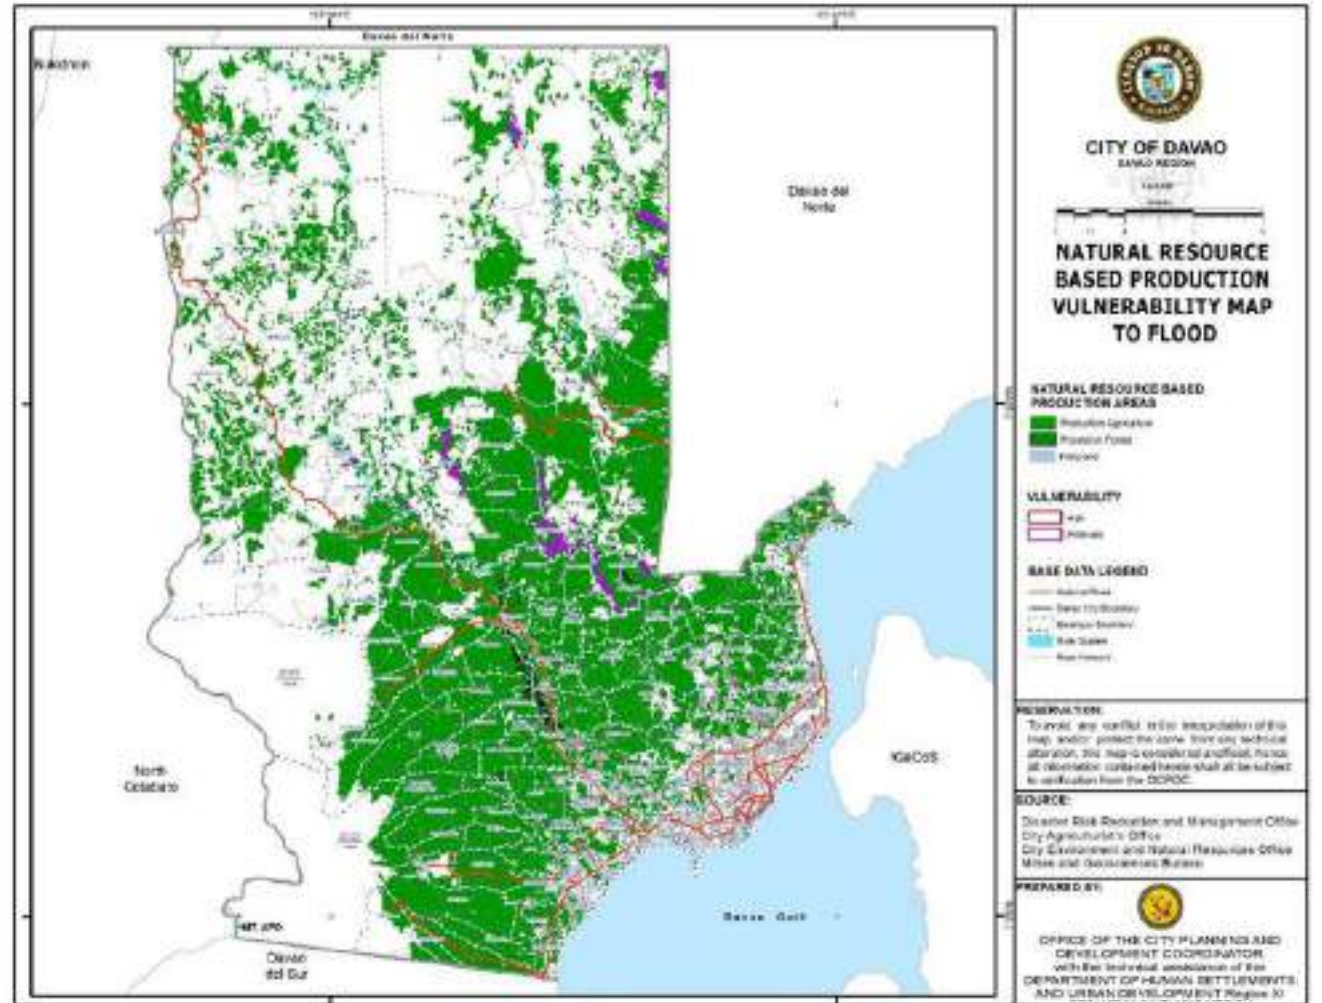

Landslide– A total of 25 barangays with NRBPA have the lowest adaptive score, where pursuing adaptation measures would be costly whenever there are landslide incidents. At least 7,452 individuals would have alternative livelihood if ever their main sources of income would be affected by landslides.

Liquefaction– All the 24 barangays NRBPA have high adaptive capacity score which means that they can address and pursue adaptation measures whenever a liquefaction would arise.

Storm Surge – A total of 12 barangays with NRBPA have moderate adaptive capacity score. These include the natural resources in Bago Aplaya, Bucana, Matina Aplaya, Talomo, Bunawan Proper, Ilang, Lasang, Panacan, Tibungco, Binugao, Lizada, and Sirawan. This means that the city government or concerned barangays with NRBPA can accommodate within its resources the cost for adapting and mitigating the hazard impacts to natural resources.

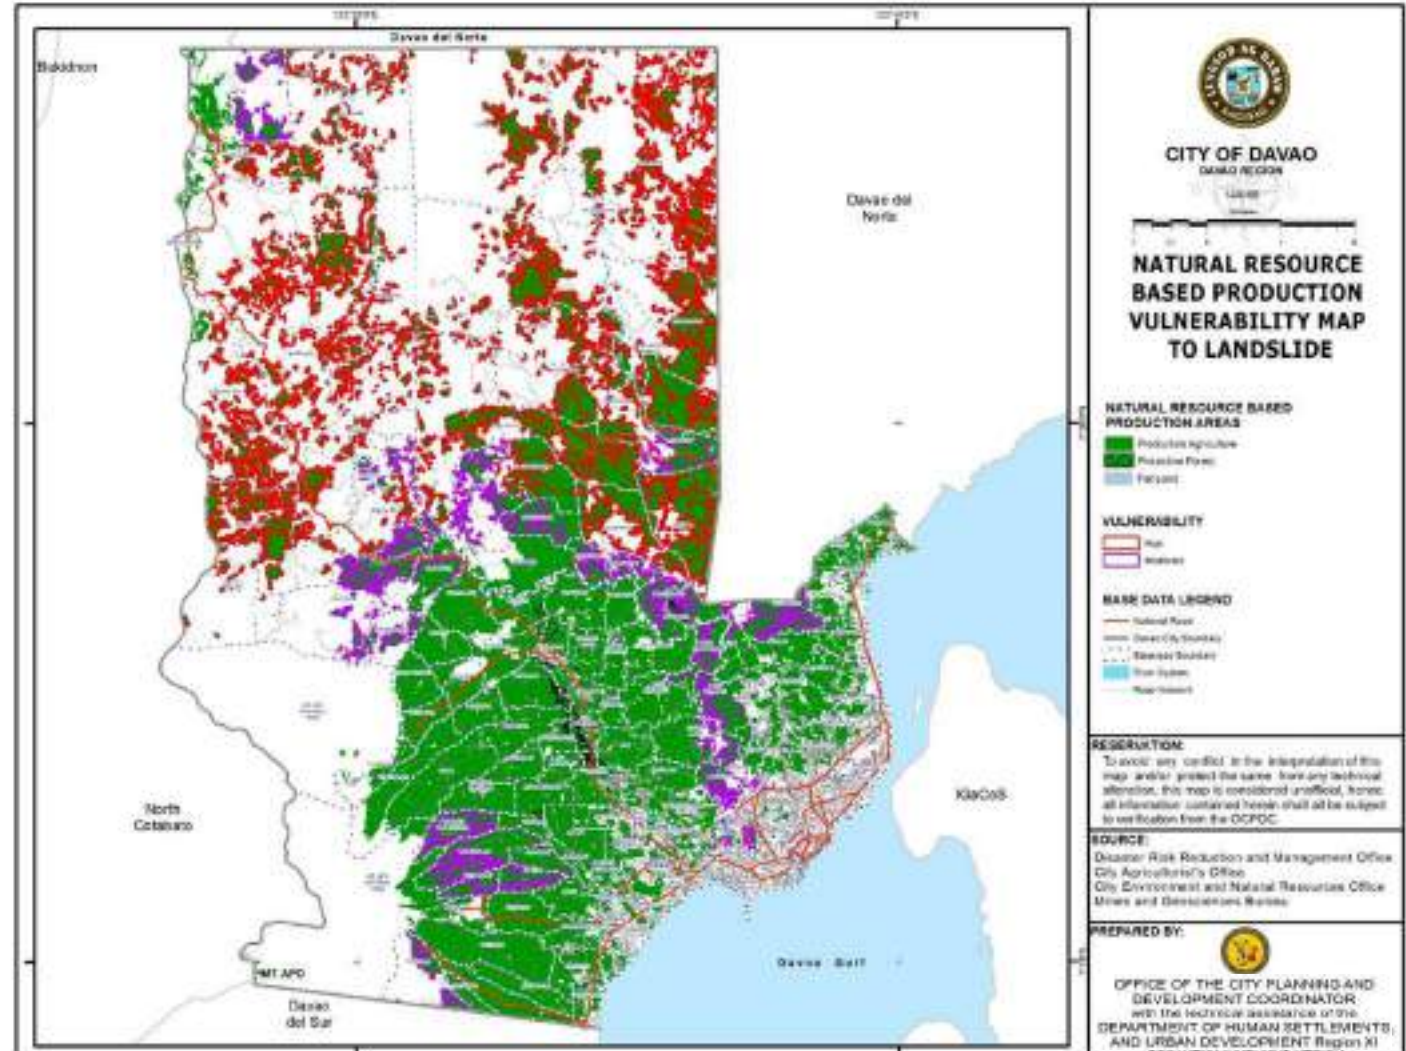

Map 1.62 Natural Resource Based Production Area Vulnerability Map, to Flood, Davao City

Flood– There are no NRBPAs that have high vulnerability scores with regards to floods. Of the 129 barangays with NRBPAs that are susceptible to floods, 11 sites have moderate vulnerability.

Map 1.62 Natural Resource Based Production Area Vulnerability Map, to Landslide, Davao City

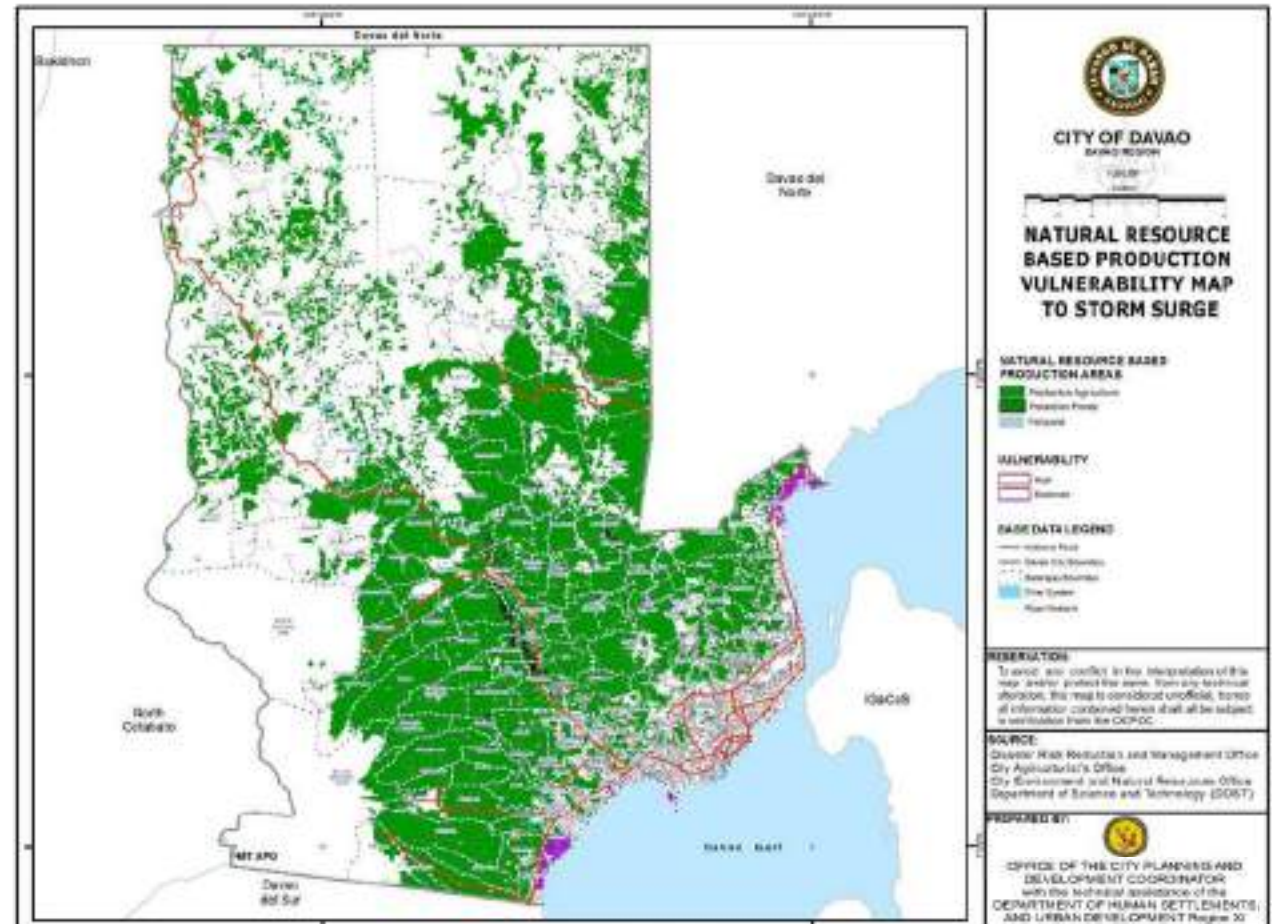

Landslide— Twenty-one (21) barangays with NRBPAs are highly vulnerable to landslides. Among these are Colosas, Fatima, Lumiad, Malabog, Mapula, Pandaitan, Panalum, Paquibato Proper, Paradise Embac, Salapawan, Sumimao, Tapak, Megkawayan, Baganihan, Dalag Lumot, Datu Salumay, Gumitan, Magsaysay, Malamba, Marilog Proper, and Salaysay.

Map 1.63 Natural Resource Based Production Area Vulnerability Map, to Storm Surge, Davao City

Storm Surge- Storm surges are expected to cause moderate impacts in NRBPA within Bago Aplaya, Bucana, Matina Aplaya, Talomo Proper, Bunawan Proper, Ilang, Lasang, Panacan, Tibungco, Binugao, Lizada, and Sirawan. Only the NRBPA in Dumoy and San Isidro have low vulnerabilities to storm surge.

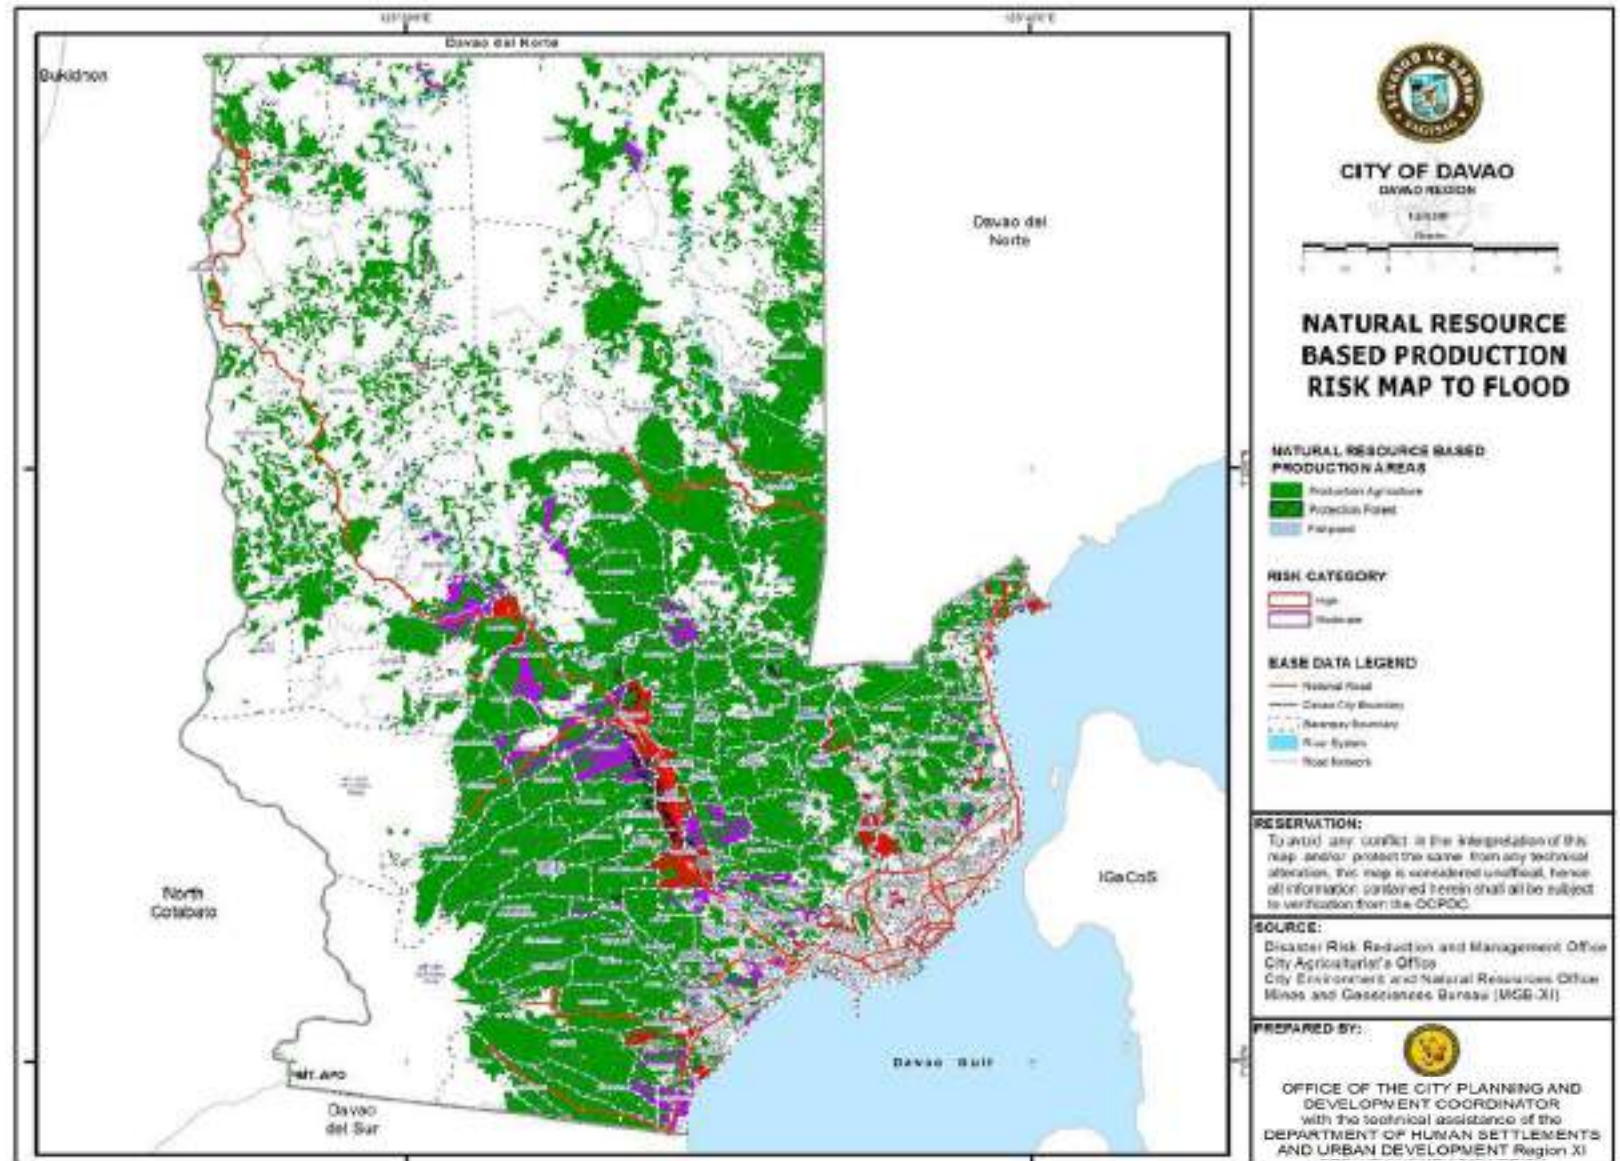

Liquefaction –All 19 barangays with NRBPA listed in the table have low vulnerabilities to liquefaction (Table CN – 21). These are Bago Aplaya, Bago Gallera, Bucana, Catalunan Grande, Dumoy, Ma-A, Matina Aplaya, Matina Crossing, Matina Pang, Talomo Proper, Mandug, Tigatto, Waan, Bunawan Proper, Ilang, Lasang, Panacan, San Isidro, Binugao, Daliao, Lizada, Sirawan, Toril Proper, and New Carmen.

Natural Resource-Based Production Area Disaster Risk Assessment for Flood

Map 1.64 Natural Resource Based Production Area Risk Map to Flood, Davao City

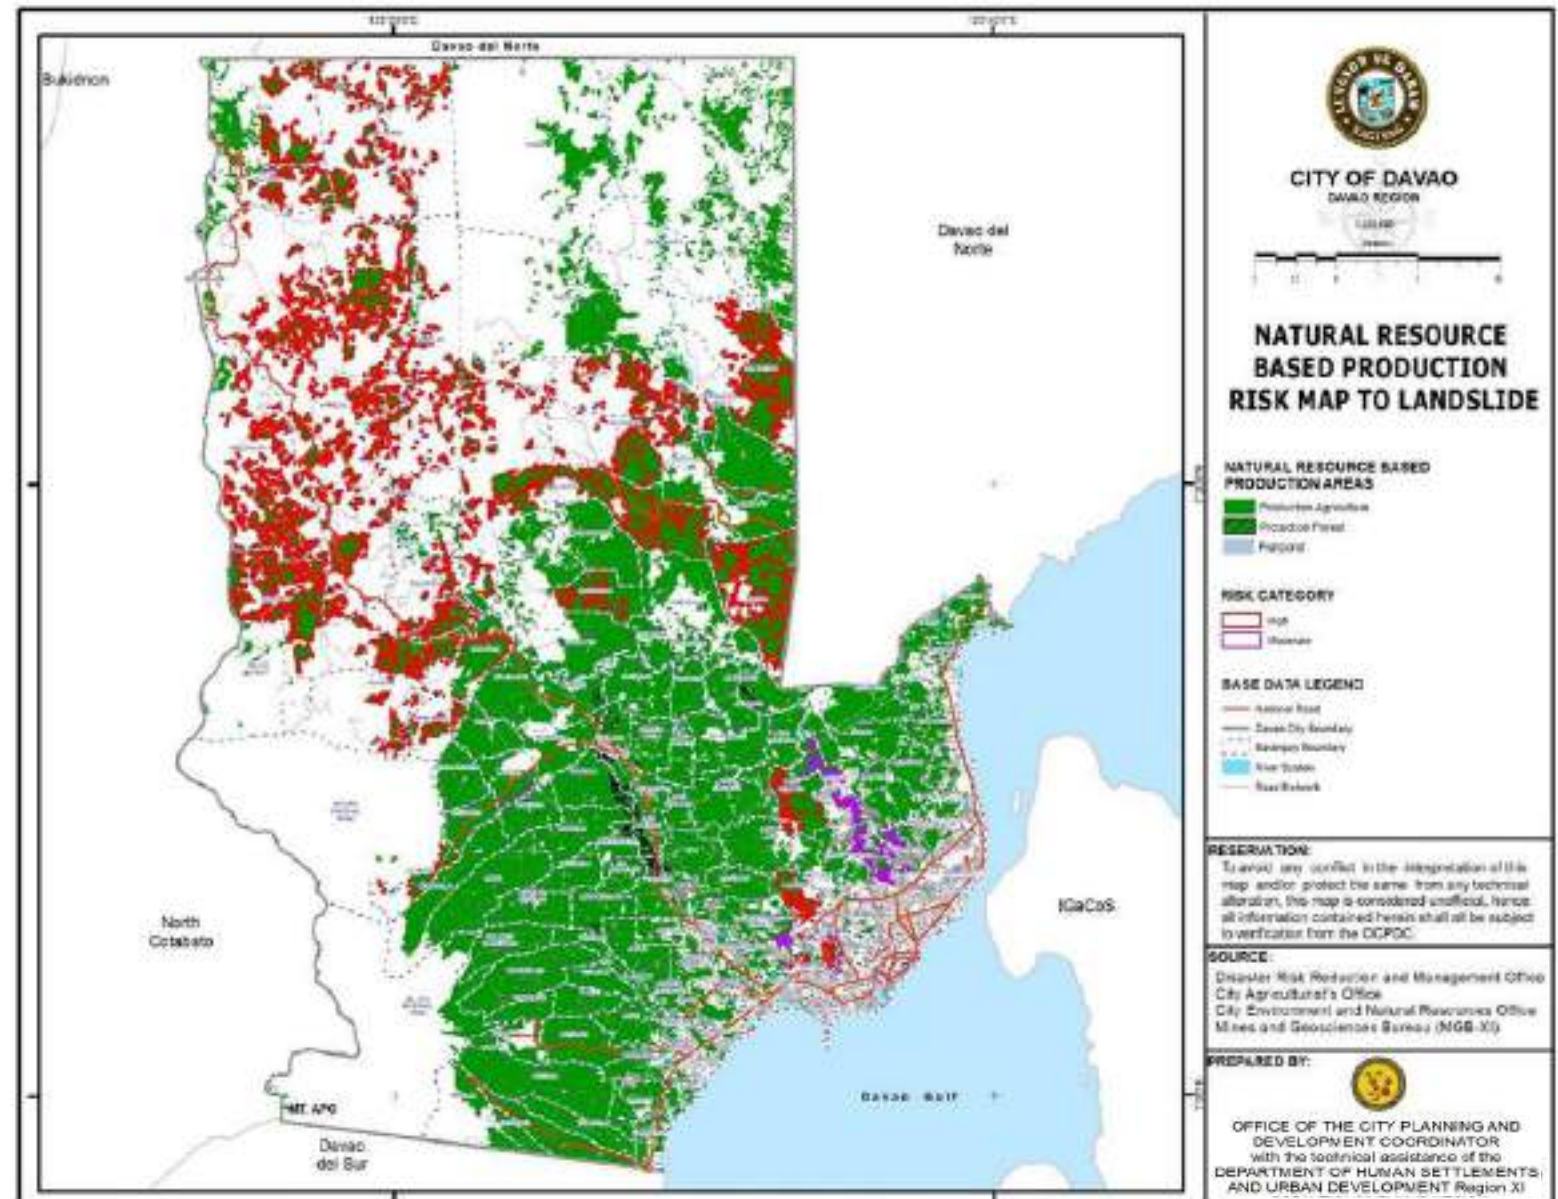

Flood – 21 barangays are at risk to flooding. Noting on the possible extent of damages to NRBPA, the natural resources in Bucana, Ma-a, Matina Aplaya, Matina Crossing, Matina Pangi, Talomo Proper, Mandug, Tigatto, Waan, Bunawan Proper, Lasang, Panacan, Calinan, Riverside, Gumitan, Tamugan, Lizada, Marapangi, Toril Proper, Los Amigos, and Tugbok Proper are identified as high risk areas.

Natural Resource-Based Production Area Disaster Risk Assessment for Landslide

Map 1.65 Natural Resource Based Production Area Risk Map to Landslide, Davao City

Landslide- 20 barangays are at risk to landslides namely, Langub, Matina Pangi, Lumiad, Malabog, Pandaitan, Paquibato Proper, Carmen, Tambobong, Inayangan, Baganihan, Buda, Datu Salumay, Gumitan, Magsaysay, Malamba, Marilog Proper, Salaysay, Suawan, Tamugan, and New Carmen

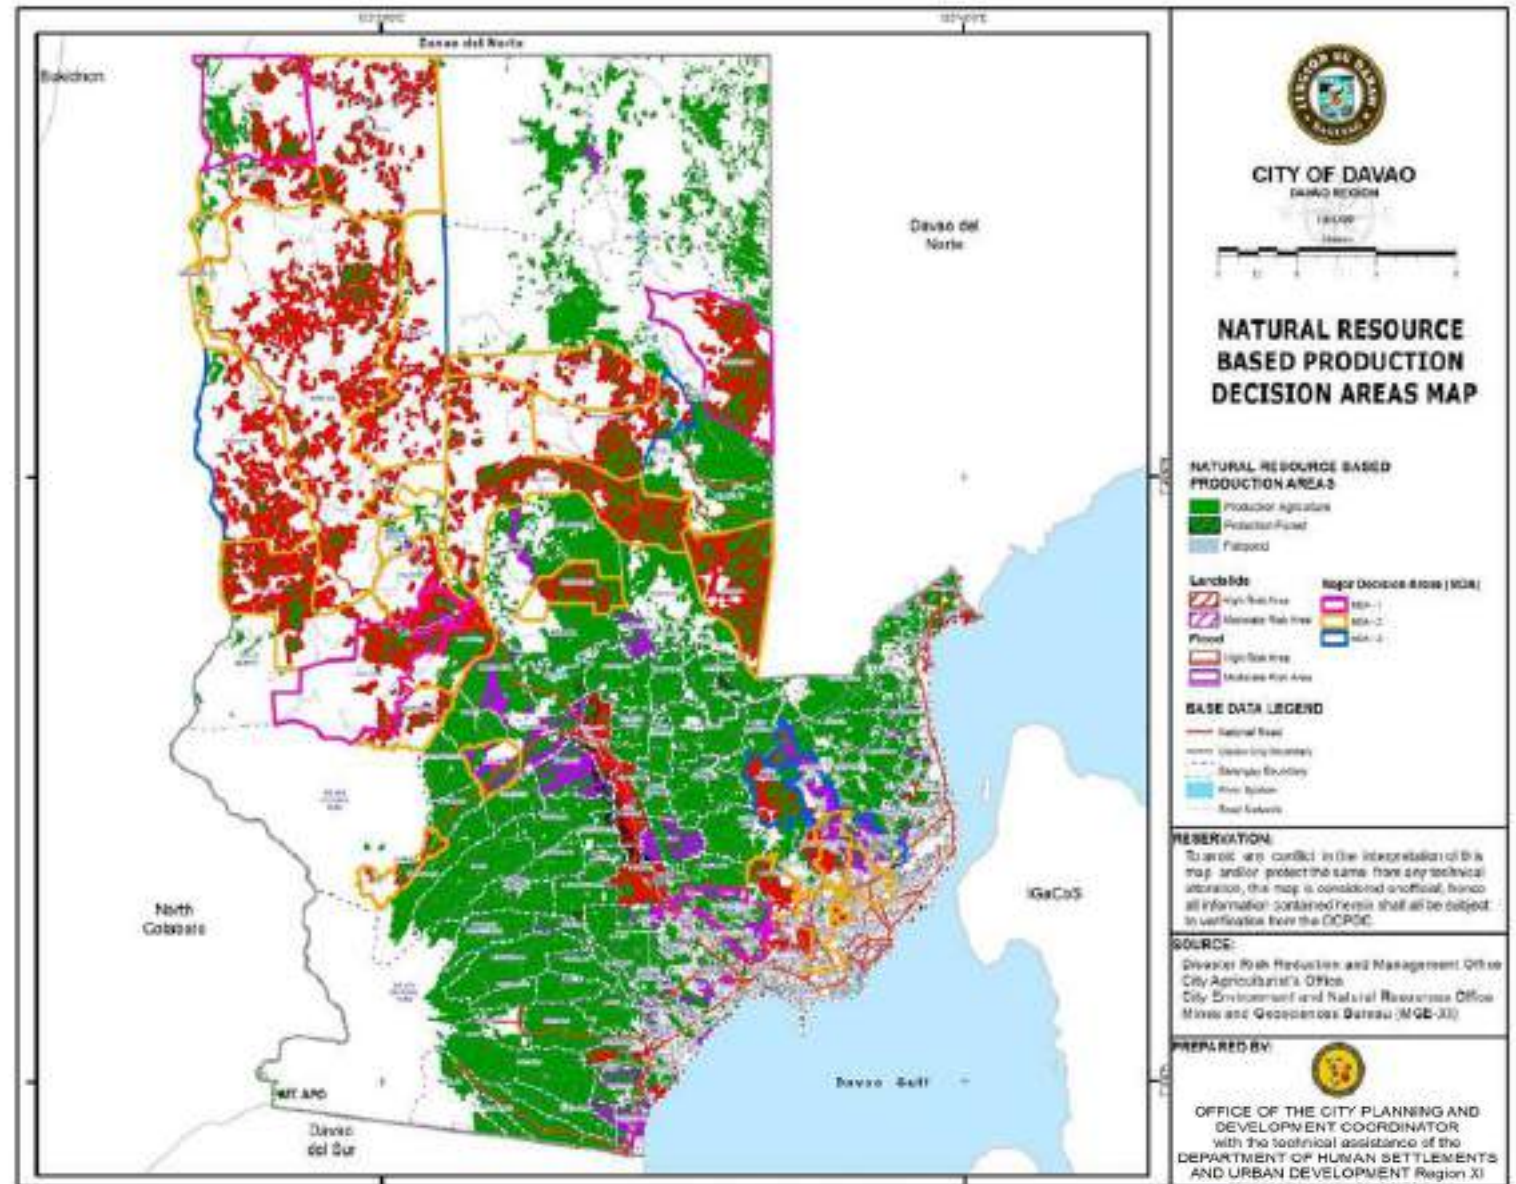

Natural Resource-Based Production Areas Major Decision Areas

Map 1.66 Natural Resource Based Production Area Decision Areas. Davao City

Major Decision Areas 1- Buda, Suawan, Pandaitan, Catalunan Grande,

Major Decision Areas 2- Baganihan, Datu Salumay, Malamba, Marilog, Salaysay, Tamugan, Fatima, Lumiad, Malabog, Carmen, Baguio, Tambobong, Inayangan, Buhangin, Tigatto, Ma-a

Major Decision Areas 3- Gumitan, Magsaysay, Paquibato, New Carmen, Cabantian, Mandug, Matina Pangil

Integrated Major Decision Areas

The Integrated Major Decision Areas categorized into Major Decision Area-1, Major Decision Area-2, Major Decision Area-3, summarizes the priority areas for intervention of the local government in terms of policies and projects in the next ten (10) years as a result of the Climate and Disaster Risk Assessment made, based on the five (5) exposed elements: Population, Critical Point Facilities, Lifeline Utilities, Natural Resource-Based Production Areas, and Urban Use.

After the assessment, Suawan, Matina Crossing, Talomo, Marilog, Tigatto, Ma-a, Matina Pangi, Panacan, Tamugan, Calinan, 19-B, Mintal, Tugbok, Bunawan, Bucana, Matina Aplaya were identified as Integrated Major Decision Areas-1. MDA-1 is the top priority area for immediate attention and implementation of risk mitigation projects and programs.

On the other hand, Buhangin, Leon Garcia Sr., 8-A, Los Amigos, Malabog, Salaysay are identified as Integrated Major Decision Areas-2. These barangays are the second highest priority, while barangays 1-A, 2-A, 5-A, 21-C, 22-C, 23-C, 31-D, Centro, Waan, Lasang, Bago-Aplaya and Catalunan Pequeño are identified as Integrated Major Decision Areas-3, the third highest priority for risk and disaster-mitigation projects.

Integrated Major Decision Areas-1

Barangay	Technical Findings	Policy Interventions
SUAWAN	This barangay has been identified as Major Decision Area-1 for Critical Point Facilities, Lifeline Utilities and NRBPA because of high landslide risk of facilities and land area.	<p>Critical Point Facilities:</p> <ul style="list-style-type: none"> • Rehabilitation and retrofitting of existing structure that employs hazard resilient design. • Future construction of critical point facilities should follow standards for hazards resiliency. • Forging partnerships with private and non-government organizations in construction of new facilities. • Conduct of Inventory and regular monitoring and evaluation of Critical Point Facilities to assess its structure and resiliency to hazards. • Strengthen the coordination and service delivery system of agencies and LGU to the affected community. • Enhance the early warning system and disaster preparedness of the communities. <p>For Lifeline Utilities:</p> <ul style="list-style-type: none"> • Crafting of contingency plans for emergency situation. • Strengthen the slope protection projects by concerned agencies. • Hazard retrofitting of existing structure Construct flood resistant river dike system especially before and after bridges that have been classified into moderate/high risk • Road concreting and increase road elevation above the flood height. • Establish road embankment protection • Improve drainage to allow flood waters to flow through culverts. <p>NRBPA</p> <ul style="list-style-type: none"> • Improve extension services with emphasis on climate and hazard resilient production techniques. • Establishment of irrigation and/or rainwater harvesting facilities to sustain 1,684.68 hectares of high value fruit tree production. • Encourage the use of risk transfer instrument (i.e. crop insurance) • Crop diversification • Changing crop and/or those crops with reduced water requirements • Establishment of early warning system for agricultural crop production • Provision of forestry based alternative and/or non-agriculture based livelihood opportunities • Reduced run-off through watershed reforestation or agro-forestry production • Establishment of warehouses for temporary storage • Establish riverbank easement (i.e. planting of malibago and fruit trees and kawayan)
SUAWAN	This barangay has been identified as Major Decision Area-1 for Critical Point Facilities, Lifeline Utilities and NRBPA because of high landslide risk of facilities and land area.	<p>For population</p> <ul style="list-style-type: none"> • Rehabilitation and retrofitting of existing structure that employs hazard resilient design. • Implement slope protection measures (e.g., installation of geo-nets in slopes) • Landslide mitigation design shall be included in the local and national budgets • Enforce the National Greening Program • Relocation program for informal settlers shall be implemented • Pursue flood control measures • The National Greening Program, which is targeted to prevent soil erosion and flooding, shall be expanded • Establish evacuation center • Set up state-of-the-art early warning device system

Integrated Major Decision Areas-1

Barangay	Technical Findings	Policy Interventions
MATINA CROSSING	<p>This barangay has been identified as Major Decision Area-1 for Population and Lifeline Utilities because of high flood and landslide risk. The Urban Uses particularly the Residential use is also at high risk to landslide leading it to be identified as MDA-3 for urban use. This barangay is also identified as MDA-3 for critical point facilities because of one (1) police substation, one (1) health center, and two (2) school facilities are at high risk to flood.</p>	<p>Population</p> <ul style="list-style-type: none"> • Strict implementation of Urban Development and Housing Act, which mandates that there shall be no dwelling units in danger areas like waterways, riverbanks, and shorelines • The informal settlers shall be relocated in tenement housing building, which should be set up within the barangay but observe an easement from the waterway • Pursue disaster control measures • The National Greening Program, which is targeted to prevent soil erosion and flooding, shall be expanded • Establish evacuation center equipped with utilities and other amenities like comfort rooms, and conjugal rooms • Set up state-of-the-art early warning device system • Strengthen the Barangay Disaster Risk Reduction and Management Council <p>Lifeline Utilities</p> <ul style="list-style-type: none"> • Hazard retrofitting of existing structure Construct flood resistant river dike system especially before and after bridges that have been classified into moderate/high risk <p>Urban Use</p> <ul style="list-style-type: none"> • Mandatory retrofitting of existing structures; formulation of flood contingency plans • LGU to provide proper evacuation plan and integrated emergency management mechanism to communities; • Educate residents on natural warning signs & the severity of disasters; • LGU to regulate illegal construction of houses on steep slopes. • Concerned agencies to require mitigating measure plan to building permit applicants for projects within landslide prone areas; • Encourage structure owners to secure building insurances. • Rehabilitation support through immediate replacement of lost or damaged land, facilities and access roads. • Government to provide structural mitigating measures such as drainage, erosion protection, vegetation, ground improvement, retaining walls/structures at the affected areas. <p>Critical Point Facilities</p> <ul style="list-style-type: none"> • Rehabilitation and retrofitting of existing structure with hazard resilient design • Construction of flood control projects like river/ seawalls, riverbank riprapping, and flood control gates and pumping stations • Regular declogging of canals and other water ways • Future construction of facilities buildings should adopt hazard resilient designs • Partnership with private and business organization for the construction of flood control projects (Adopt-A-School Program) • Strengthen community early warning system and disaster preparedness activity in the community • Establish service delivery networks • Forging partnerships with private and non-government organizations in construction of new facilities.

Integrated Major Decision Areas-1		
Barangay	Technical Findings	Policy Interventions
		<ul style="list-style-type: none"> • Conduct of Inventory and regular monitoring and evaluation of Critical Point Facilities to assess its structure and resiliency to hazards • Strengthen the coordination and service delivery system of agencies and LGU to the affected community. • Enhance the early warning system and disaster preparedness of the communities.
TALOMO	This barangay has been identified as Major Decision Area-1 for Population and Lifeline Utilities, and Major Decision Area-3 for Critical Point Facilities and Urban Use because of moderate to high flood risk and landslide risk of exposed area.	<p>Critical Point Facilities</p> <ul style="list-style-type: none"> • Rehabilitation and retrofitting of existing structure with hazard resilient design • Construction of flood control projects like river/ seawalls, riverbank riprapping, and flood control gates and pumping stations • Regular declogging of canals and other water ways • Future construction of facilities buildings should adopt hazard resilient designs • Partnership with private and business organization for the construction of flood control projects (Adopt-A-School Program) • Strengthen community early warning system and disaster preparedness activity in the community • Establish service delivery networks • Forging partnerships with private and non-government organizations in construction of new facilities. • Conduct of Inventory and regular monitoring and evaluation of Critical Point Facilities to assess its structure and resiliency to hazards • Strengthen the coordination and service delivery system of agencies and LGU to the affected community. • Enhance the early warning system and disaster preparedness of the communities. <p>Urban Use</p> <ul style="list-style-type: none"> • Mandatory retrofitting of existing structures; • LGU to provide proper evacuation plan and integrated emergency management mechanism to communities; • Educate residents on natural warning signs & the severity of disasters; • LGU to regulate illegal construction of houses on steep slopes. • Concerned agencies to require mitigating measure plan to building permit applicants for projects within landslide prone areas; • Encourage structure owners to secure building insurances. • Rehabilitation support through immediate replacement of lost or damaged land, facilities and access roads. • Government to provide structural mitigating measures such as drainage, erosion protection, vegetation, ground improvement, retaining walls/structures at the affected areas. <p>Lifeline Utilities</p> <ul style="list-style-type: none"> • Hazard retrofitting of existing structure Construct flood resistant river dike system especially before and after bridges that have been classified into moderate/high risk <p>NRBPA</p> <ul style="list-style-type: none"> • Improve extension services with emphasis on climate and hazard resilient production techniques. • Encourage the use of risk transfer instrument (i.e. crop insurance) • Improve extension services with emphasis on climate and hazard resilient production techniques. • Encourage the use of risk transfer instrument (i.e. crop insurance) • Crop diversification • Changing crop and/or those crops with reduced water requirements • Provision of forestry based alternative and/or non-agriculture based livelihood opportunities • Reduced run-off through watershed reforestation or agro-forestry production • Establish riverbank easement (i.e. planting of malibago and fruit trees and kawayan)

Integrated Major Decision Areas-1

Barangay	Technical Findings	Policy Interventions
		<p>Population</p> <ul style="list-style-type: none"> • Strict implementation of Urban Development and Housing Act, which mandates that there shall be no dwelling units in danger areas like waterways, riverbanks, and shorelines • The informal settlers shall be relocated in tenement housing building, which should be set up within the barangay but observe an easement from the waterway • Pursue disaster control measures • The National Greening Program, which is targeted to prevent soil erosion and flooding, shall be expanded • Establish evacuation center equipped with utilities and other amenities like comfort rooms, and conjugal rooms • Set up state-of-the-art early warning device system • Strengthen the Barangay Disaster Risk Reduction and Management Council
MARILOG	<p>This barangay is identified as Major Decision Area-1 for Critical Point Facilities and Urban Use, and Major Decision Area 2 for Natural Resource Based Production Areas and Population because of high landslide risk.</p>	<ul style="list-style-type: none"> • Rehabilitation and retrofitting of existing structure that employs hazard resilient design. • Future construction of critical point facilities should follow standards for hazards resiliency. <p>Population</p> <ul style="list-style-type: none"> • Forging partnerships with private and non-government organizations in construction of new facilities • Conduct of Inventory and regular monitoring and evaluation of Critical Point Facilities to assess its structure and resiliency to hazards. • Strengthen the coordination and service delivery system of agencies and LGU to the affected community. • Enhance the early warning system and disaster preparedness of the communities. <p>NRBPA</p> <ul style="list-style-type: none"> • Rehabilitation and retrofitting of existing structure that employs hazard resilient design. • Future construction of critical point facilities should follow standards for hazards resiliency. • Forging partnerships with private and non-government organizations in construction of new facilities • Conduct of Inventory and regular monitoring and evaluation of Critical Point Facilities to assess its structure and resiliency to hazards. • Strengthen the coordination and service delivery system of agencies and LGU to the affected community. • Enhance the early warning system and disaster preparedness of the communities. <p>Urban Use</p> <ul style="list-style-type: none"> • LGU to provide proper evacuation plan and integrated emergency management mechanism to communities; • Educate residents on natural warning signs and the severity of disasters; • LGU to regulate illegal construction of houses on steep slopes; • Rehabilitation support through immediate replacement of lost or damaged land, facilities and access roads.

Integrated Major Decision Areas-1

Barangay	Technical Findings	Policy Interventions
TIGATTO	<p>This area has been identified as Major Decision Area-1 for Population and MDA-2 for NRBPA, Lifeline Utilities, because of the flood risk and vulnerability to storm surge. This barangay is also identified as MDA-2 for Urban Use because of high landslide risk for industrial and residential areas.</p>	<p>Lifeline Utilities</p> <ul style="list-style-type: none"> ● Hazard retrofitting of existing structure ● Hazard retrofitting of existing structure ● Establishment of alternate roads parallel to existing bridge, to ensure uninterrupted linkage <p>NRBPA</p> <ul style="list-style-type: none"> ● Improve extension services with emphasis on climate and hazard resilient production techniques. Encourage the use of risk transfer instrument (i.e. crop insurance); Improve extension services with emphasis on climate and hazard resilient production techniques. ● Establishment of irrigation and/or rainwater harvesting facilities to sustain 354.51 hectares of high value fruit tree production. ● Encourage the use of risk transfer instrument (i.e. crop insurance) ● Crop diversification ● Changing crop and/or those crops with reduced water requirements ● Establishment of early warning system for agricultural crop production ● Provision of forestry based alternative and/or non-agriculture based livelihood opportunities ● Reduced run-off through watershed reforestation or agro-forestry production ● Establishment of warehouses for temporary storage ● Establish riverbank easement (i.e. planting of malibago and fruit trees and kawayan) <p>Population</p> <ul style="list-style-type: none"> ● Strict implementation of Urban Development and Housing Act, which mandates that there shall be no dwelling units in danger areas like waterways, riverbanks, and shorelines ● The informal settlers shall be relocated in tenement housing building, which should be set up within the barangay but observe an easement from the waterway ● Pursue flood control measures ● The National Greening Program, which is targeted to prevent soil erosion and flooding, shall be expanded ● Establish evacuation center equipped with utilities and other amenities like comfort rooms, and conjugal rooms ● Set up state-of-the-art early warning device system ● Strengthen the Barangay Disaster Risk Reduction and Management Council <p>Urban Use</p> <ul style="list-style-type: none"> ● LGU to provide proper evacuation plan and integrated emergency management mechanism to communities; ● Educate residents on natural warning signs & the severity of disasters; ● LGU to regulate illegal construction of houses on steep slopes.; ● Concerned agencies to require mitigating measure plan to building permit applicants for projects within landslide prone areas; ● Encourage structure owners to secure building insurances. ● Rehabilitation support through immediate replacement of lost or damaged land, facilities and access roads.; ● Government to provide structural mitigating measures such as drainage, erosion protection, vegetation, ground improvement, retaining walls/ structures at the affected areas.

Climate Change Vulnerability Assessment for Lifeline Utilities

Lifeline Utilities are systems of infrastructure that enable connectivity and sustainability of basic utilities and communication services within the community. Roads, bridges, cellular towers, waterlines, and transmission towers are among the lifeline utilities that the community needs to survive.

Climate stimuli such as increase in temperature and the increase in rainfall can bring direct and indirect impacts to our lifeline utilities. The increase in temperature directly yields drought that can have various effects such as uneven flexible road pavement, power loss, and increase of power and water demand. These direct effects may cause traffic congestion, power and water interruption which put the daily productivity and income of a community at risk. Meanwhile, increase in rainfall, brings about rain-induced hazards such as flooding, landslide and sea level rise. Occurrence of these hazards is detrimental to the roads and telecommunication structures. Debris from the landslide render road networks and some roads impassable depending on the severity of the landslide.

A thorough assessment of the vulnerability of this utilities provides opportunity to develop mitigation measures to assure survival and adaptability of the utilities upon hazard occurrence.

Exposure Database

The exposure database contains baseline information on potentially affected elements for lifeline utilities. It describes vulnerabilities/sensitivities/ adaptive capacities using indicators. It provides the baseline information for the conduct of the Climate Change Vulnerability Assessment and Disaster Risk Assessment.

INDICATOR	DESCRIPTION
EXPOSURE	
Classification	The general classification or use of the lifeline (Road, Water distribution network, power)
Length/Distance	Estimated linear meters/kilometers
Construction/replacement cost	Estimated construction cost per linear kilometers
SENSITIVITY/VULNERABILITY	
Construction Materials Used	Construction materials used (i.e Concrete, Asphalt, Gravel, Dirt)
Condition	Qualitative assessment of the existing condition of the distribution/access network
Structure employing hazard mitigation design	Proportion of structures employing site preparation, hazard resistant and/or climate proofed design standards
ADAPTIVE CAPACITY	
Insurance Coverage	Proportion of structures covered by insurance
Government Infrastructure Related Investment	Local government capacity to invest in infrastructure related projects (mitigation and construction of redundant systems)

Exposure Database for Roads

A total of 15 portions are highly susceptible to flood. The Davao Bukidnon Road has the longest road network exposed at 15.67 meters. It is followed by Fatima-Malabog Road with 8.8631 meters exposed and Carlos P. Garcia Highway with 4.9353 meters.

Table LU –1. Lifeline Utilities, Roads, Exposure Database for Flood, Davao City

EXPOSURE				SENSITIVITY			ADAPTIVE CAPACITY	
ROAD NAME	HAZARD SUSCEPTIBILITY	EXPOSED LENGTH (KILOMETERS)	REPLACEMENT COST PER LINEAR KILOMETER	SURFACE TYPE	EXISTING CONDITION	HAZARD RESISTANT	INSURANCE COVERAGE	AVAILABLE GOVERNMENT RESOURCES
2nd Avenue	HF	0.0055	60,000,000	concrete	good	Yes	No insurance but has local fund for rehabilitation and improvement	Quick Response fund

Exposure Database for Bridges

A total of 26 bridges are located in a high flood-susceptibility area, due to the location of the bridges in major rivers. The top three (3) bridges which are assessed to be highly susceptible to flood are Bolton Bridge 2 with 185.30 meters exposed length, Bolton Bridge 1 with 185.30 meters exposed length , and Davao River Bridge with 141.11 meters exposed length.

Almost all bridges made of concrete are in good condition with hazard resistant design. All existing bridges do not have damage insurance coverage and addressing damages are mostly done through repairs/retrofitting using either national government fund resources or those funded by regional line agencies. As to the available financial resource, DPWH XI has available resources to fund improvements. However, fund availability depends upon current priorities.

Table LU –1. Lifeline Utilities, Bridges, Exposure Database for Flood, Davao City

EXPOSURE				SENSITIVITY			ADAPTIVE CAPACITY	
NAME	HAZARD SUSCEPTIBILITY	EXPOSED LENGTH (LINEAR METERS)	REPLACEMENT COST PER LINEAR METER	SURFACE TYPE	EXISTING CONDITION	HAZARD RESISTANT DESIGN	INSURANCE COVERAGE	AVAILABLE GOVERNMENT RESOURCES
Agdao Flyover	M	382.98	1,200,000	Concrete	Good	Yes	All existing bridges do not have damage insurance coverage. Addressing damages are mostly done thru repairs/retrofitting using either national government fund resources or those funded by regional line agencies	DPWH-XI has available financial resources to fund improvements of national bridges, however fund availability will depend upon their current priorities. Also, the LGU can impose special levy taxes for project benefitting its local constituents but the latter may not be able to pay the additional taxes.
Angalan Br. I	H	12.10	1,200,000	Concrete	Good	Yes	All existing bridges do not have damage insurance coverage. Addressing damages are mostly done thru repairs/retrofitting using either national government fund resources or those funded by regional line agencies	DPWH-XI has available financial resources to fund improvements of national bridges, however fund availability will depend upon their current priorities. Also, the LGU can impose special levy taxes for project benefitting its local constituents but the latter may not be able to pay the additional taxes.
Angalan Br. II	H	11.92	1,200,000	Concrete	Good	Yes	All existing bridges do not have damage insurance coverage. Addressing damages are mostly done thru repairs/retrofitting using either national government fund resources or those funded by regional line agencies	DPWH-XI has available financial resources to fund improvements of national bridges, however fund availability will depend upon their current priorities. Also, the LGU can impose special levy taxes for project benefitting its local constituents but the latter may not be able to pay the additional taxes.

NAME	HAZARD SUSCEPTIBILITY	EXPOSED LENGTH (LINEAR METERS)	REPLACEMENT COST PER LINEAR METER	SURFACE TYPE	EXISTING CONDITION	HAZARD RESISTANT DESIGN	INSURANCE COVERAGE	AVAILABLE GOVERNMENT RESOURCES
Angalan Br. II	H	11.92	1,200,000	Concrete	Good	Yes	All existing bridges do not have damage insurance coverage. Addressing damages are mostly done thru repairs/retrofitting using either national government fund resources or those funded by regional line agencies	DPWH-XI has available financial resources to fund improvements of national bridges, however fund availability will depend upon their current priorities. Also, the LGU can impose special levy taxes for project benefitting its local constituents but the latter may not be able to pay the additional taxes.
Angalan Br. III	H	48.88	1,200,000	Concrete	Good	Yes	All existing bridges do not have damage insurance coverage. Addressing damages are mostly done thru repairs/retrofitting using either national government fund resources or those funded by regional line agencies	DPWH-XI has available financial resources to fund improvements of national bridges, however fund a availability will depend upon their current priorities. Also, the LGU can impose special levy taxes for project benefitting its local constituents but the latter may not be able to pay the additional taxes.
Angalan Br. IV	H	15.90	1,200,000	Concrete	Good	Yes	All existing bridges do not have damage insurance coverage. Addressing damages are mostly done thru repairs/retrofitting using either national government fund resources or those funded by regional line agencies	DPWH-XI has available financial resources to fund improvements of national bridges, however fund availability will depend upon their current priorities. Also, the LGU can impose special levy taxes for project benefitting its local constituents but the latter may not be able to pay the additional taxes.
Angalan Br. V	H	18.00	1,200,000	Concrete	Good	Yes	All existing bridges do not have damage insurance coverage. Addressing damages are mostly done thru repairs/retrofitting using either national government fund resources or those funded by regional line agencies	DPWH-XI has available financial resources to fund improvements of national bridges, however fund availability will depend upon their current priorities. Also, the LGU can impose special levy taxes for project benefitting its local constituents but the latter may not be able to pay the additional taxes.

Also, the LGU can impose special levy taxes for project benefitting its local constituents but the latter may not be able to pay the additional taxes.

Map 5.1. Lifeline Utilities Exposure Map to Flooding, Davao City

Exposure Database for Power Substations

A total of three (3) substations are located in high flood susceptibility area. These are: Calinan Substation, Tugbok Substation and Matina Substation. These newly upgraded substations were made of concrete and steel. These are designed to withstand typhoon, earthquake, fire, flood, oil spill, and sabotage and terrorism. As for its adaptive capacity, the substations have risk insurance.

Table LU– 3. Lifeline Utilities, Power Substations, Exposure Database for Flood, Davao City

EXPOSURE				SENSITIVITY/VULNERABILITY			ADAPTIVE CAPACITY	
NAME OF POWER PLANT	FLOOD SUSCEPTIBILITY	AREA OCCUPIED (SQ.M)	REPLACEMENT COST	CONSTRUCTION MATERIALS USED	EXISTING CONDITION	HAZARD RESISTANT DESIGN	INSURANCE COVERAGE	AVAILABLE GOVERNMENT RESOURCES
Calinan Sub-station	High/Very High	1,000.00	140 Million	a) Perimeter Fence : Concrete High Wall Fence (5.5m HT) b) Control Building: Concrete Wall and Floor ; with Roofdeck c) Equipment Support : All Steel Structures	a) Operational b) Newly Up-graded	a) Typhoon Resistance b) Earthquake Resistance c) Fire Resistance d) Flood Resistance e) Oil Spill Resistance f) Sabotage & Terrorism	a) Industrial All Risk Insurance b) Comprehensive General Liability	NONE
Tugbok Sub-station	High	1,809.00	130 Million	a) Perimeter Fence: Concrete High Wall Fence (2.5m HT); and 2" cyclone wire Fence along roadside b) Control Building: Pre-painted Metal Sheet Cladding Wall and Concrete Floor ; Pre-painted Roofing Sheet. c) Equipment Support : All Steel Structures	a) Operational b) Upgraded Within past 5 years	a) Typhoon Resistance b) Earthquake Resistance c) Fire Resistance d) Flood Resistance e) Oil Spill Resistance	a) Industrial All Risk Insurance b) Comprehensive General Liability	NONE
Matina Sub-station	High	1,000.00	120 Million	a) Perimeter Fence : Concrete Fence (3.0m HT) b) Control Building: Concrete Wall and Floor ; PU Panel Roof c) Equipment Support : All Steel Structures	a) Operational b) Upgraded Within past 5 years	a) Typhoon Resistance b) Earthquake Resistance c) Fire Resistance d) Flood Resistance e) Oil Spill Resistance f) Sabotage & Terrorism	a) Industrial All Risk Insurance b) Comprehensive General Liability	NONE

Map 5.2. Lifeline Utilities Exposure Map of Power Substations to Flooding, Davao City

Exposure Database for Water Level I

A total of three (3) spring sources in Tibungco, two (2) spring sources in Panacan and Binugao, and one (1) well from Lizada are highly susceptible to flood. The replacement cost for each spring source is ₱41586.32. As these are spring sources, they do not have hazard resistant design, insurance coverage and government resources availability can be obtained only upon request.

Apart from that, 26 spring sources and deep wells in Bunawan, Talomo, River, Ula, Riverside, Daliao and Sirawan are moderately susceptible to flood.

Exposure Database for Level II Water System

A total of eleven (11) spring sources and six (6) deep wells found in Binugao, Sirawan, Sibulan, Mt. Apo National Park, Tungkalan, Daliaon Plantation, Subasta, Waan, Cawayan, Baguio, Malagos, Salaysay are highly susceptible to flood. Spring sources have an estimated replacement cost of ₱41,586.32 each. As for deep wells, replacement cost varies per type. Spring sources do not have hazard resistant design, while deep wells do have a casing which protects it from flood.

Exposure Database for Water Level III

Out of 205,952.31 meters of main line pipes, 6,624.29 meters are highly susceptible to flood. The longest line pipe is in Ma-a with 1,153.29 meters, followed by 629.46 meters located in Barangay Talomo, 644.79 meters located in Barangay Ma-a. The size of mainline pipes range from 150-1000 mm and its type include MLCSP and PVC. All of these pipes are in good condition and has been designed to withstand flooding. There is no insurance coverage allotted, however, the DCWD allots 3% of its sales for the repair/maintenance/rehabilitation of these mainline pipes.

Exposure Database for DCWD Production Wells

DCWD has a total of 66 wells susceptible to flood, of which, six (6) vertical turbine wells are highly susceptible to flood. These wells are found in Kilometer 7, Talomo Sump Bangkal, and Barangay Talomo, Davao-Cotabato Road, near Bago Bridge, Brgy. Bago Aplaya, Catotal Subdivision near Block 22, Brgy. Bago Aplaya, Mangahan Bridge Alambre, Toril, Tugbok Quarry, Along Davao Bukidnon Road, Brgy. Tugbok, and Los Amigos. Each has a replacement cost of ₱6,500,000. Based on DCWD, these wells are in good condition. As to hazard resistant design, these wells also designed to withstand hazards. On the other hand, as to insurance coverage, there is none, however for the available government resources, the DCWD will allot 3% of their annual sales for the maintenance of the wells.

Map 5.3 Lifeline Utilities, Water, Exposure Map to Flooding, Davao City

Exposure Database for Cell sites

Davao City has a total of 129 cell sites susceptible to flood. Out of the total number, four (4) cell sites are highly vulnerable to flood. These are located in Mc Arthur Highway, Brgy. 74-A, Matina Crossing; Magno Property, No. 64 V. Mapa St.; Brgy. 11-B, #88 Maya St.; Brgy. 76-A, Ecoland, Brgy. Bucana. These cell sites occupy an average of 300 square meters each, with replacement cost ranging from ₱12-P15 million. These cell sites are also made of steel and concrete. Hazard resistant design is also employed for each cell site. Moreover, all of the cell sites have no insurance coverage and available government resources.

Map 5.4 Lifeline Utilities, Cell Sites, Exposure Map to Flooding, Davao City

Landslide

Exposure Database

A total of eight (8) road networks have high landslide susceptibility. The major road is the Davao Bukidnon Road which has the highest exposed length up to 15.84 kilometers, having a replacement cost of 40,000,000. Aside from the Davao Bukidnon Road, portions of Calinan-Baguio-Cadalian road (0.8466 kilometers), Carlos P. Garcia Highway (4.9353 kilometers), Eden Tagurano Road (0.1042 kilometers), Fatima-Malabog Road (8.8631 kilometers), and Inawayan-Baracatan Road (1.8346 kilometers), Mabuhay Pañalum-Paquibato Road (0.4214 kilometers) and Toril Bayabas-Eden Road (0.8748 kilometers) are highly susceptible to landslide. The highest replacement cost would be the stretch of road in Carlos P. Garcia Highway.

Map 5.5 Lifeline Utilities, Bridges, Exposure Map to Landslide, Davao City

Exposure Database for Power Substations

Tibungco substation is the only substation which is moderately susceptible to landslide. The remaining substations have low landslide susceptibility. The replacement cost for the substation is 118 million. It is mainly made of concrete and steel materials. It can be noted that all of the power substations have hazard resistant design.

Tibungco substation is the only substation which is moderately susceptible to landslide. The remaining substations have low landslide susceptibility. Toril Substation	Low	1,125	125 Million	a) Perimeter Fence : Concrete High Wall Fence (5.5m HT) b) Control Building: Concrete Wall and Floor ; PU Panel Roof c) Equipment Support : All Steel Structures	a) Operational b) Newly Upgraded	a) Typhoon Resistance b) Earthquake Resistance c) Fire Resistance d) Flood Resistance	a) Industrial All Risk Insurance b) Comprehensive general Liability	NONE
Dumoy Substation	Low	1,322	118 Million	a) Perimeter Fence: Cyclone Wire (2") on G.I. Pipe Frame b) Control Building: G.I. Sheet walls, not insulated. c) Equipment Support : All Galvanized Steel Structures	a) Operational b) Last upgraded 10 yrs. ago.	b) Earthquake Resistance d) Flood Resistance e) Oil Spill Resistance	a) Industrial All Risk Insurance b) Comprehensive general Liability	NONE
Tibungco Substation	Moderate	2,626.00	118 Million	a) Perimeter Fence :CHB Fence with top Guard Cyclone Wire (2") on G.I. Pipe Frame b) Control Building: P.U. Panel walls and roof. c) Equipment Support : All Galvanized Steel Structures	a) Operational b) Last upgraded 10 yrs. ago.	b) Earthquake Resistance d) Flood Resistance e) Oil Spill Resistance	a) Industrial All Risk Insurance b) Comprehensive general Liability	NONE
Toril Substation	Low	1,125	125 Million	a) Perimeter Fence : Concrete High Wall Fence (5.5m HT) b) Control Building: Concrete Wall and Floor ; PU Panel Roof c) Equipment Support : All Steel Structures a) Perimeter Fence : Cyclone Wire (2") on G.I. Pipe Frame b) Control Building: G.I. Sheet walls, not insulated.	a) Operational b) Newly Upgraded a) Operational	a) Typhoon Resistance b) Earthquake Resistance c) Fire Resistance d) Flood Resistance b) Earthquake Resistance d) Flood Resistance	a) Industrial All Risk Insurance b) Comprehensive general Liability a) Industrial All Risk Insurance	NONE
Dumoy Substation	Low	1,322	118 Million	c) Equipment Support : All Galvanized Steel Structures	b) Last upgraded 10 yrs ago.	e) Oil Spill Resistance	b) Comprehensive general Liability	

Table LU– 11. Lifeline Utilities, Power Substations, Exposure Database Table for Landslide, Davao City

EXPOSURE				SENSITIVITY/VULNERABILITY			ADAPTIVE CAPACITY	
Name of Power Plant	Landslide Susceptibility	Area Occupied (sq.m)	Replacement Cost	Construction Materials Used	Existing Condition	Hazard Resistant Design	Insurance Coverage	Available Government Resources
Puan Substation	Low	803	85 Million	a) Perimeter Fence : Concrete Fence b) Control Building: Concrete Wall and Floor ; PU Panel Roof c) Equipment Support : All Steel Structures	a) Operational b) Upgraded Within past 5 years	a) Typhoon Resistance b) Earthquake Resistance c) Fire Resistance e) Oil Spill Resistance	a) Industrial All Risk Insurance b) Comprehensive general Liability	NONE
Calinan Substation	Low	1,000.00	140 Million	a) Perimeter Fence : Concrete High Wall Fence (5.5m HT)	a) Operational	a) Typhoon Resistance	a) Industrial All Risk Insurance	NONE
Tugbok Substation	Low	1,809.00	130 Million	a) Perimeter Fence : Concrete High Wall Fence (2.5m HT); and 2" cyclone wire Fence along roadside b) Control Building: Repainted Metal Sheet Cladding Wall and Concrete Floor; Repainted Roofing Sheet. c) Equipment Support : All Steel Structures	a) Operational b) Upgraded Within past 5 years	a) Typhoon Resistance b) Earthquake Resistance c) Fire Resistance d) Flood Resistance	a) Industrial All Risk Insurance b) Comprehensive general Liability	NONE
Bangkal Substation'	Low	1,142.00	85 Million	a) Perimeter Fence: Cyclone Wire (2") on G.I. Pipe Frame b) Control Building: G.I. Sheet walls, not insulated. c) Equipment Support : All Galvanized Steel Structures	a) Operational b) Last upgraded 10 yrs. ago.	e) Oil Spill Resistance	a) Industrial All Risk Insurance b) Comprehensive general Liability	NONE
Matina Substation	Low	1,000.00	120 Million	a) Perimeter Fence : Concrete Fence (3.0m HT) b) Control Building: Concrete Wall and Floor ; PU Panel Roof c) Equipment Support : All Steel Structures	a) Operational b) Upgraded Within past 5 years	a) Typhoon Resistance b) Earthquake Resistance c) Fire Resistance d) Flood Resistance e) Oil Spill Resistance f) Sabotage & Terrorism	a) Industrial All Risk Insurance b) Comprehensive general Liability	NONE

Exposure Database for Level II Water Supply System

A total of 57 spring sources and 8 wells are highly susceptible to landslide. These sources are located in Acacia, Bantol, Camansi, Carmen, Dalag Lumot, Gatungan, Gumalang, Gumitan, Lampianao, Lumiad, Magsaysay, Malabog, Malamba, Mapula, Marilog, Megkawayan, Mt. Apo National Park, Mudiang, New Carmen, Panalum, Pandaitan, Paquibato, Paraise Embac, Salaysay, Saloy, Sibulan, Suawan, Tambobong, Tapak, Tungkalan.

Exposure Database for Level III Water Supply System

Barangays 19-B, Buhangin, Catalunan Grande, Langub, Ma-a, Magtuod, Matina Crossing, Matina Pangi, Panacan, Talomo, and Tigatto are among the areas which portions of mainline pipes are highly susceptible to landslide. Buhangin has the longest length of mainlines highly susceptible, with a total length of 1,021 meters.

Barangays 19-B, Buhangin, Catalunan Grande, Langub, Ma-a, Magtuod, Matina Crossing, Matina Pangi, Panacan, Talomo, and Tigatto are among the areas which portions of mainline pipes are highly susceptible to landslide. Buhangin has the longest length of mainlines highly susceptible, with a total length of 1,021 meters.

Map 5.8 Lifeline Utilities, Water, Exposure Map for Landslide, Davao City

Exposure Database of Cell Site Towers

A total of 13 cell site towers are highly susceptible to landslide. Two (2) Digital Mobile towers, three (3) Globe Telecom, and eight (8) Smart Communication Towers. The Digital Towers are located in Diversion Road, Bangkal and Matina RS. The Globe Telecom Towers are located in Lloures Building, McArthur Highway, Shrine Hills Matina, and Lot 19, Blk 17, Bacaca Road. On the other hand, the Smart Communication Towers are located at Telstar St. GSIS Subdivision, Shrine Hills Matina, 796 Tigatto, Buhangin, Barangay Panorama, Diversion Road Barangay Catitipan, Communal Road, Buhangin District, Water Tank, Palos Verdes Golf, and Barangay Malabog, Paquibato District.

Map 5.10 Lifeline Utilities, Cell Sites, Exposure Map to Landslide, Davao City

Liquefaction

Exposure Database for Road

The road with longest exposed length is the Davao Agusan Highway with 11. 2802 kilometers highly susceptible to liquefaction. It is followed by McArthur Highway with an exposed length of 5.1120 kilometers, thereafter followed by Quezon Boulevard, with 4. 2215 kilometers exposed length. As to the Replacement cost, roads with highest replacement cost per kilometer are Quezon Boulevard and Rafael Castillo St., with the replacement cost of ₱86,000,000.

Table LU-17. Lifeline Utilities, Roads, Exposure Database for Liquefaction, Davao City

ROAD NAME	EXPOSURE			SENSITIVITY			ADAPTIVE CAPACITY	
	HAZARD SUSCEPTIBILITY	EXPOSED LENGTH (KILOMETERS)	REPLACEMENT COST PER LINEAR KILOMETER	SURFACE TYPE	EXISTING CONDITION	HAZARD RESISTANT	INSURANCE COVERAGE	AVAILABLE GOVERNMENT RESOURCES
2nd Avenue	High	0.2056	60,000,000	concrete	good	Yes	No insurance but has local fund for rehabilitation and improvement	Quick Response fund

Exposure Database for Bridges

For bridges, highly susceptible to liquefaction and with the longest exposed length is the Agdao Flyover with a total of 382.98 meters exposed length. This is followed by Bunawan Bridge 1 with an exposed length of 49.76 meters, followed by Bunawan Bridge 2 with a total exposed length of 47.79. All these bridges have a replacement cost per line per kilometer of ₱1, 200,000.

For bridges, highly susceptible to liquefaction and with the longest exposed length is the Agdao Flyover with a total of 382.98 meters exposed length. Map 5.7 Lifeline Utilities, Bridges, Exposure Map to Active Fault Line and Liquefaction, Davao City

Exposure Database for Power Substations

Dumoy Substation, Puan Substation, P. Reyes Substation, Gaisano Substation, Sta. Ana, R.Castillo, Panacan, Pampanga, have high susceptibility to liquefaction. Each has a replacement cost ranging from P 85 million– P 118 million. These substations are made of steel and concrete materials. For existing condition, Dumoy Substation and Puan Substation were upgraded in the last 10 years and last 5 years respectively. The two substations which are highly susceptible to liquefaction are resistant to earthquake, flood, and oil spill. The two substations also have industrial risk insurance and comprehensive general liability. Both have no available government resources primarily because it is maintained and rehabilitated by the Davao Light and Power Company.

Exposure Database for Level III Water System

Out of 755 mainline pipes, a total of 433 mainline pipes are highly exposed and 186 are moderately exposed to liquefaction. Bago Aplaya has the highest exposed length 1,547.52, which is a combined length of three long mainline pipes with 600 mm diameter. Bago Aplaya is followed by Dumoy with an exposed length of 461 meters and Matina Crossing with 424.59 meters. The exposed length of pipe in Matina Crossing is 750 mm diameter.

Map 5.10. Lifeline Utilities, Cell Sites, Exposure Map to Active Fault and Liquefaction, Davao City

Storm Surge

Exposure Database for Road

Road networks which are exposed to 5-meter wave susceptibility are the Carlos P. Garcia Highway, Dacudao Avenue, Davao Agusan Highway, Davao Bukidnon Road, Florentino Torres St, J.P Cabaguio, J. P Avenue, Libby Road, McArthur Highway, Airport Road, Pichon St., Quimpo Boulevard, and Quirino Avenue. The highest road length exposed to 5-m wave is the Quirino Avenue, with 0.2722 kilometers exposed.

Exposure Database for Bridge

A total of four (4) bridges are exposed to storm surge 3-meter wave. These are Bago Bridge, Ilang Bridge, Talomo Bridge 1, and Talomo Bridge 2. Talomo Bridge 2 has the longest area susceptible to storm surge at 48.11 meters.

Table LU-27. Lifeline Utilities, Bridges, Exposure Database for Storm Surge, Davao City

EXPOSURE				SENSITIVITY			ADAPTIVE CAPACITY	
ROAD NAME	EXPOSED LENGTH (LINEAR METERS)	REPLACEMENT COST PER LINEAR METER	VALUE OF EXPOSED LIFELINE	SURFACE TYPE	EXISTING CONDITION	HAZARD RESISTANT	INSURANCE COVERAGE	AVAILABLE GOVERNMENT RESOURCES
Bago Br.	31.21	1,200,000	37,452,000	-	Good	Yes	All existing bridges do not have damage insurance coverage. Addressing damages are mostly done thru repairs/retrofitting using either national government fund resources or those funded by regional line agencies.	Regional DPWH has available financial resources to fund national bridges improvements but fund availability will depend on their current priorities. Also, LGU can impose special levy taxes for project benefitting its local constituents but local capacities may not be able to pay the additional taxes.
Ilang Br.	25.70	1,200,000	30,840,000	-	Good	Yes	All existing bridges do not have damage insurance coverage. Addressing damages are mostly done thru repairs/retrofitting using either national government fund resources or those funded by regional line agencies.	Regional DPWH has available financial resources to fund national bridges improvements but fund availability will depend on their current priorities. Also, LGU can impose special levy taxes for project benefitting its local constituents but local capacities may not be able to pay the additional taxes.
Talomo Br. 1	48.10	2,053,000	98,749,300	-	Good	Yes	All existing bridges do not have damage insurance coverage. Addressing damages are mostly done thru repairs/retrofitting using either national government fund resources or those funded by regional line agencies.	Regional DPWH has available financial resources to fund national bridges improvements but fund availability will depend on their current priorities. Also, LGU can impose special levy taxes for project benefitting its local constituents but local capacities may not be able to pay the additional taxes.
Talomo Br. 2	48.11	2,053,000	98,769,830	-	Good	Yes	All existing bridges do not have damage insurance coverage. Addressing damages are mostly done thru repairs/retrofitting using either national government fund resources or those funded by regional line agencies.	Regional DPWH has available financial resources to fund national bridges improvements but fund availability will depend on their current priorities. Also, LGU can impose special levy taxes for project benefitting its local constituents but local capacities may not be able to pay the additional taxes.

Map 5.11 Lifeline Utilities, Bridges, Exposure Map to Storm Surge, Davao City

Power Substations Exposure Database for Storm Surge

A total of 12 substations are susceptible to either 2-meter, 3-meter, 4-meter and 5-meter storm surge. Those which are susceptible 5-meter storm surge are Dumoy Substation, Bajada Substation, ERA Substation, and Don Ramon Substation, which is also exposed to (2-meter, 3-meter, and 4-meter Storm Surge).

Table LU-28. Power Substations Exposure Database for Storm Surge with 2-meter Wave, Davao City

EXPOSURE			SENSITIVITY/VULNERABILITY			ADAPTIVE CAPACITY	
NAME OF POWER PLANT	AREA OCCUPIED (SQ.M)	REPLACEMENT COST	CONSTRUCTION MATERIALS USED	EXISTING CONDITION	HAZARD RESISTANT DESIGN	INSURANCE COVERAGE	AVAILABLE GOVERNMENT RESOURCES
Sta Ana Substation	607.00	135 Million	a) Perimeter Fence : Concrete High Wall Fence (5.5m HT) & Bended Metal Sheets b) Control Building: Concrete Wall and Floor ; with Roofdeck c) Equipment Support : All Steel Structures	a) Operational b) Newly Upgraded	a) Typhoon Resistance b) Earthquake Resistance c) Fire Resistance d) Flood Resistance e) Oil Spill Resistance f) Sabotage & Terrorism	a) Industrial All Risk Insurance b) Comprehensive General Liability	NONE
R.Castillo Substation	852.00	125 Million	a) Perimeter Fence : Concrete High Wall Fence (3.5m HT) b) Control Building: Concrete Wall and Floor ; PU Panel Roof c) Equipment Support : All Steel Structures	a) Operational b) Newly Upgraded	a) Typhoon Resistance b) Earthquake Resistance c) Fire Resistance d) Flood Resistance e) Oil Spill Resistance f) Sabotage & Terrorism	a) Industrial All Risk Insurance b) Comprehensive General Liability	NONE
Pampanga Substation	1031.00	118 Million	a) Perimeter Fence : Cyclone Wire (2") on G.I. Pipe Frame b) Control Building: G.I. Sheet walls, not insulated. c) Equipment Support : All Galvanized Steel Structures	a) Operational b) Last upgraded 10 yrs ago.	b) Earthquake Resistance d) Flood Resistance e) Oil Spill Resistance	a) Industrial All Risk Insurance b) Comprehensive General Liability	NONE
Don Ramon Substation	15540.00	570 Million	a) Perimeter Fence : Concrete High Wall Fence with Steel Grating (3.0m HT) b) Control Building: Concrete Wall and Floor ; G.I. Roof Panels c) Equipment Support : All Steel Structures	a) Operational b) Upgraded 5 years ago.	a) Typhoon Resistance b) Earthquake Resistance c) Fire Resistance d) Flood Resistance e) Oil Spill Resistance f) Sabotage & Terrorism	a) Industrial All Risk Insurance b) Comprehensive General Liability	NONE

Map 5.12 Lifeline Utilities Exposure Map to Storm Surge, Davao City

Exposure Database of Level II Water Supply for Storm Surge

Level I Water Supply Exposure to Storm Surge

A total of 60 spring sources are susceptible to storm surge with 2-meter wave (50%), 3-meter wave 16%), 4-meter wave (.06%), and 5-meter wave (.1%). These are found in barangays Binugao, Bunawan Daliao, Lizada, Mahayag, Sirawan, Tibungco, and Suawan. For 5-meter storm surge, six (6) spring sources in Daliao, Toril and one (1) spring source in Barangay Bunawan are susceptible.

Level II Water Supply Exposure to Storm Surge

Only two (2) wells located in Barangay Sirawan are susceptible to storm surge with 2-meter wave. The replacement cost of each is ₱46,200. For the hazard resistant design, each well has a casing. For insurance coverage, there is no insurance coverage but there is one (1) month warranty if the water pump is installed by the supplier.

Exposure Database of Level III Water Supply for Storm Surge

There are 624 mainline pipes susceptible to 2-meter, 3-meter, and 4-meter and 5-meter storm surge with a total length of 62,374.42 meters. The highest percentage or 37% is susceptible to 2-meter wave. Meanwhile, the shortest percentage or 14% is susceptible to storm surge with 5-meter wave. Main line pipes susceptible to 5-meter wave are found in Barangays 10-A, 11-B, 12-B, 19-B, 2-A, 5-A, 6-A, 7-A, 9-A, Bago-Aplaya, Bago Gallera, Bucana, Buhangin, Dumoy, Ilang, Ma-a, Matina Aplaya, Matina Crossing, Panacan, Sasa, Talomo, Tibungco and Wilfredo Aquino.

Faultline

Exposure Database of Roads for Active Fault

A total of five (5) road networks, namely Calinan-Baguio-Cadalian Road, Davao Bukidnon Road, Fatima-Malabog Road, Inawayan-Baracatan Road and McArthur highway are exposed to active fault. For Calinan-Baguio-Cadalian Road, 0.0106 kilometers is exposed to Lacson Fault, and another 0.0108 kilometers is exposed to Tamugan Fault. Meanwhile, Davao-Bukidnon-Road is the road length which is exposed to three fault lines, 0.0482 kilometers of the same road length is exposed to Dacudao Fault, another 0.0179 kilometers is exposed to Lacson Fault, and 0.0100 kilometers is exposed to Tamugan Fault. On the other hand, Inawayan-Baracatan Road exposed to Lacson Fault with 0.0100 kilometers exposed length. Fatima-Malabog Road is also exposed to Pangyan-Biao Escuela Fault with a total 0.0427 kilometers exposed length. Additionally, a .0100 kilometers McArthur Highway is also exposed to Lacson Fault.

Table LU-32. Lifeline Utilities, Roads, Exposure Database for Exposure Database for Faultline, Davao City

EXPOSURE				SENSITIVITY			ADAPTIVE CAPACITY	
ROAD NAME	HAZARD SUSCEPTIBILITY	EXPOSED LENGTH (KILOMETERS)	REPLACEMENT COST PER LINEAR KILOMETER	SURFACE TYPE	EXISTING CONDITION	HAZARD RESISTANT	INSURANCE COVERAGE	AVAILABLE GOVERNMENT RESOURCES
Calinan-Baguio-Cadalian Road	Lacson Fault	0.0106	35,000,000	concrete	good	Yes	No insurance but has local fund for rehabilitation and improvement	Quick Response fund
Calinan-Baguio-Cadalian Road	Tamugan Fault	0.0108	35,000,000	concrete	good	Yes	No insurance but has local fund for rehabilitation and improvement	Quick Response fund
Davao-Bukidnon Road	Dacudao Fault	0.0100	40,000,000	concrete	good	Yes	No insurance but has local fund for rehabilitation and improvement	Quick Response fund
Davao-Bukidnon Road	Tamugan Fault	0.0100	40,000,000	concrete	good	Yes	No insurance but has local fund for rehabilitation and improvement	Quick Response fund

Exposure Database of Bridges for Faultline

Lipadas Bridge 1 and Lipadas Bridge 2 are exposed to Tamugan Fault, with an exposed length of 37.80 meters and 40 meters, respectively.

Table LU-32. Lifeline Utilities, Bridges, Exposure Database for Exposure Database for Faultline, Davao City

EXPOSURE				SENSITIVITY			ADAPTIVE CAPACITY	
ROAD NAME	HAZARD SUSCEPTIBILITY	EXPOSED LENGTH (LINEAR METERS)	REPLACEMENT COST PER LINEAR METER	SURFACE TYPE	EXISTING CONDITION	HAZARD RESISTANT	INSURANCE COVERAGE	AVAILABLE GOVERNMENT RESOURCES
Lipadas Br. 1	Tamugan Fault	37.80	1,200,000.00	Concrete	Good	Yes	All existing bridges do not have damage insurance coverage. Addressing damages are mostly done thru repairs/retrofitting using either national government fund resources or those funded by regional line agencies.	Regional DPWH has available financial resources to fund national bridges improvements but fund availability will depend on their current priorities. Also, LGU can impose special levy taxes for project benefitting its local constituents but local capacities may not be able to pay the additional taxes.

Table LU-32. Lifeline Utilities, Bridges, Exposure Database for Exposure Database for Faultline, Davao City

EXPOSURE				SENSITIVITY			ADAPTIVE CAPACITY	
ROAD NAME	HAZARD SUSCEPTIBILITY	EXPOSED LENGTH (LINEAR METERS)	REPLACEMENT COST PER LINEAR METER	SURFACE TYPE	EXISTING CONDITION	HAZARD RESISTANT	INSURANCE COVERAGE	AVAILABLE GOVERNMENT RESOURCES
Lipadas Br. II	Tamugan Fault	40.00	1,200,000.00	Concrete	Good	Yes	All existing bridges do not have damage insurance coverage. Addressing damages are mostly done thru repairs/retrofitting using either national government fund resources or those funded by regional line agencies.	Regional DPWH has available financial resources to fund national bridges improvements but fund availability will depend on their current priorities. Also, LGU can impose special levy taxes for project benefitting its local constituents but local capacities may not be able to pay the additional taxes.

Exposure Database of Level II Water Supply for Active Fault

Only a 3HP well in Manambulan is exposed to Tamugan Fault. The well has a total replacement cost of ₱60,500.

Table LU-33. Lifeline Utilities, Level II Water System, Exposure Database Table for Faultline, Davao City

EXPOSURE				SENSITIVITY		ADAPTIVE CAPACITY		FAULT
BARANGAY	SUSCEPTIBILITY	TYPE	REPLACEMENT COST	EXISTING CONDITION	HAZARD RESISTANT DESIGN	INSURANCE COVERAGE	AVAILABILITY OF GOVERNMENT RESOURCES	
MANAMBULAN	Tamugan Fault	3 HP	60,500	FAIR	Yes: casing of the well	None, but there is one (1) month warranty if the waterpump is installed by the supplier	Yes. Subject to proposal	Tamugan Fault

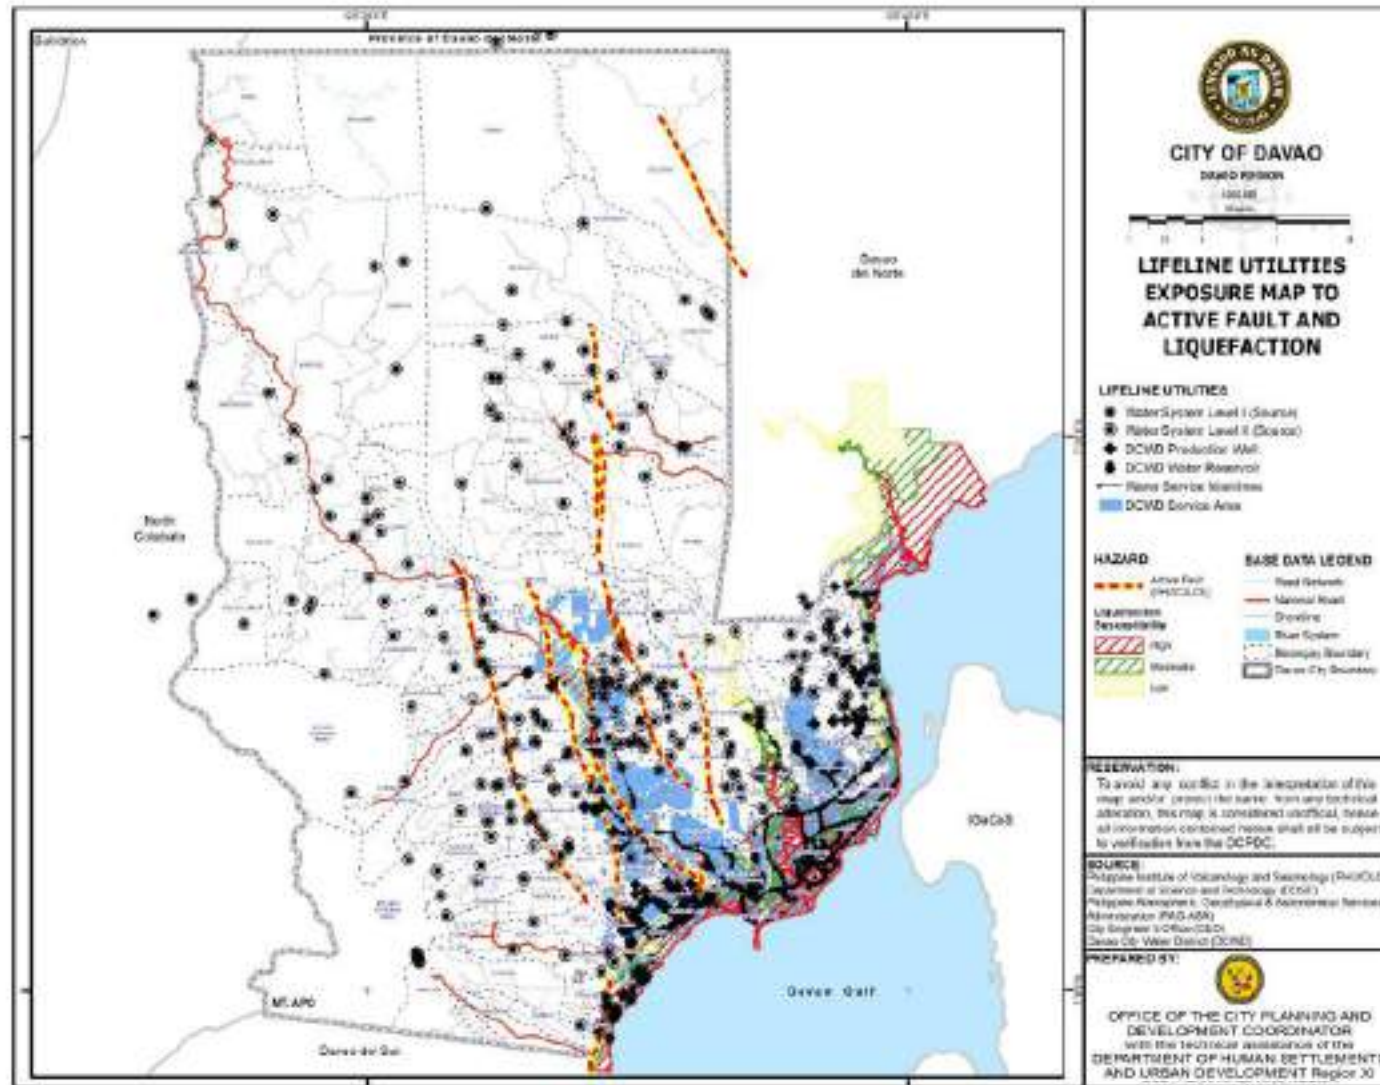

Exposure Database of Level III Water Supply for Active Fault

A total of seven (7) barangays with mainlines are exposed to Lacson and Dacudao Fault. If analyzed per fault, mainlines in Catalunan Grande, Los Amigos, Mintal and Talomo are exposed to Dacudao Fault with an exposed length of 10.37 meters, 35.73 meters, 11.19 meters, and 10.02 meters respectively. Calinan, Tugbok, and Wangan, on the other hand, are exposed to Lacson Fault, with exposed lengths of 10.63 meters, 10.04 meters, and 9.04 meters, respectively.

Table LU-34. Lifeline Utilities, Level III Water System, Exposure Database Table for Faultline, Davao City

EXPOSURE					SENSITIVITY		ADAPTIVE CAPACITY		FAULT
BARANGAY	TYPE	SIZE	REPLACEMENT COST	LENGTH	EXISTING CONDITION	HAZARD RESISTANT DESIGN	INSURANCE COVERAGE	AVAILABILITY OF GOVERNMENT RESOURCES	
WANGAN	PVC	200	12,500.00	0.12	GOOD	YES	NONE	DCWD reserve fund	Lacson Fault

Map 5.14 Lifeline Utilities, Exposure Map to Active Fault and Liquefaction, Davao City

Exposure Estimation for Flood

The replacement cost per road ranges from ₱25,000,000 to ₱86,000,000. The highest value of exposed lifeline falls along the 51-kilometer stretch of Davao-Bukidnon Road with a value of ₱2,251,600,000. It is followed by Davao Agusan Highway at ₱1, 014,216,000 with a length of 18.111 kilometers with a replacement cost per linear kilometer of ₱56,000,000. The third with the highest value was the Fatima-Malabog Road with the total value of P ₱971,238,600.

Exposure Estimation for Bridges

Bolton Bridge 2 has the highest value with a total cost of ₱236, 256,000. It is followed by Bolton Bridge 1 with the total value of ₱222,360,000. Davao River Bridge has the third highest value at ₱169, 332,000.

Table LU– 36. Lifeline Utilities, Bridges, Exposure Estimation Table for Flood, Davao City

EXPOSURE				SENSITIVITY			ADAPTIVE CAPACITY	
ROAD NAME	EXPOSED LENGTH (LINEAR METERS)	REPLACEMENT COST PER LINEAR METER	VALUE OF EXPOSED LIFELINE	SURFACE TYPE	EXISTING CONDITION	HAZARD RESISTANT DESIGN	INSURANCE COVERAGE	AVAILABLE GOVERNMENT RESOURCES
Agdao Flyover	382.98	1,200,000	459,576,000	Concrete	Good	Yes	All existing bridges do not have damage insurance coverage. Addressing damages are mostly done thru repairs/retrofitting using either national government fund resources or those funded by regional line agencies.	Regional DPWH has available financial resources to fund national bridges improvements but fund availability will depend on their current priorities. Also, LGU can impose special levy taxes for project benefitting its local constituents but local capacities may not be able to pay the additional taxes.
Angalan Br. I	12.10	1,200,000	14,520,000	Concrete	Good	Yes	All existing bridges do not have damage insurance coverage. Addressing damages are mostly done thru repairs/retrofitting using either national government fund resources or those funded by regional line agencies.	Regional DPWH has available financial resources to fund national bridges improvements but fund availability will depend on their current priorities. Also, LGU can impose special levy taxes for project benefitting its local constituents but local capacities may not be able to pay the additional taxes.
Angalan Br. II	11.92	1,200,000	14,304,000	Concrete	Good	Yes	All existing bridges do not have damage insurance coverage. Addressing damages are mostly done thru repairs/retrofitting using either national government fund resources or those funded by regional line agencies.	Regional DPWH has available financial resources to fund national bridges improvements but fund availability will depend on their current priorities. Also, LGU can impose special levy taxes for project benefitting its local constituents but local capacities may not be able to pay the additional taxes.
